

Type 947C High Capacitance, High Current, DC Link Capacitors

Metallized Polypropylene Dielectric

Type 947C series uses the most advanced metallized film technology for long life, high reliability in DC link applications. Their high-voltage and high-current ratings allow for replacement of series-parallel banks of aluminum electrolytic capacitors in high ripple current applications.

Applications

Inverters: >5kW

Renewable Energy Inverters: Wind, Solar, Fuel Cell

Aircraft Inverters: Power Supplies and Motor Drives

Transportation: Electric Vehicles, Traction

Industrial: Welders, Motor Drives, Elevators, and Overhead Cranes

Specifications

Capacitance Range: 160 μ F to 730 μ F

Tolerance: $\pm 10\%$

Rated Voltage: 800 Vdc, 1000 Vdc, 1200 Vdc

Operating Temperature Range With Ripple: -40°C to $+85^{\circ}\text{C}$

Maximum rms Current: 60 A @ $+55^{\circ}\text{C}$

Maximum rms Voltage: <230 Vac

Test Voltage Between Terminals @ 25°C : 150% rated DC voltage for 10 s

Test Voltage Between Terminals and Case @ 25°C : 4 kVac @ 50/60 Hz for 1 min

Life Test: 5000 h @ $+85^{\circ}\text{C}$, rated voltage

Complies with the EU Directive 2002/95/EC requirement restricting the use of Lead (Pb), Mercury (Hg), Cadmium (Cd), Hexavalent chromium (Cr(VI)), PolyBrominated Biphenyls (PBB) and PolyBrominated Diphenyl Ethers (PBDE).

1. Rated Current is for temperature rise of $+40^{\circ}\text{C}$ at 1–20 kHz.

2. θ_{cc} is core-to-case thermal resistance at 0–10 kHz. For higher frequency see **Expected Lifetime Predictions**.

3. θ_{ca} is case-to-ambient thermal resistance for still air. For moving air see **Expected Lifetime Predictions**.

Type 947C High Capacitance, High Current, DC Link Capacitors

Expected Lifetime vs Applied Voltage and Core Temp

Expected Lifetime Predictions

To use the Expected Lifetime curves calculate V_a/V_r and core temperature T . Start by estimating:

Applied dc voltage V_a
 Ripple Current I
 Ripple Frequency f
 Ambient Temperature T_a
 Airflow speed v

Units:

$A = m^2$ $T, T_a \text{ \& } T_c = ^\circ C$
 $C = \mu F$ $\theta, \theta_{ca} \text{ \& } \theta_{cc} = ^\circ C/W$
 $ESR = m\Omega$ $v = m/s$
 $f = kHz$ $V_a \text{ \& } V_r = V_{dc}$
 $I = A$

NOTE: The temperature rise in the 947C is $I^2(ESR)$ times the thermal resistance θ . The ESR is mainly the metal resistance; the metal resistance is the 10 kHz ESR. For operation below 10 kHz add the dielectric resistance. It is the dielectric dissipation factor—no more than 0.0002—times the capacitive reactance, i.e., $0.0002/(2\pi fC)$. That's equal to $31.83/(fC)$.

1. Start with the 10 kHz ESR from the Ratings table. If frequency is less than 10 kHz, add $31.83/(fC)$.

2. Compute total thermal resistance θ as the sum of core-to-case thermal resistance θ_{cc} and case-to-ambient thermal resistance θ_{ca} . Both are in the Ratings table but θ_{ca} is for still air and θ_{cc} is for 10 kHz or less. For frequency > 10 kHz multiply θ_{cc} by $[1+(f-10)/100]$, e.g., for 75 kHz multiply θ_{cc} by 1.65. For moving air use the capacitor surface area A and airflow speed v to calculate $\theta_{ca} = 1/[A(5+17(v+0.1)^{0.66})]$.

3. Compute V_a/V_r and the core temperature T .
 $T = T_a + I^2(ESR)\theta$

4. Look up estimated lifetime from the Expected Lifetime curves.

5. If you want a longer expected lifetime, choose a capacitor with higher voltage rating or consider using multiple capacitors in parallel to share the ripple current.

Permissible Voltage Surge Duty for 100,000 Hour
 Life Expectancy at 50 °C Core Temperature

Factor	Duration	Frequency
1.67x	≤ 100 ms	1x/day
1.50x	≤ 5 minutes	1x/day
1.30x	≤ 2.5 hours	1x/day
1.10x	≤ 9.6 hours	1x/day
1.00x	balance (11.9 h)	1x/day
