

## Features

Input voltage ranges from 8 to 385 VDC and 85 to 264 VAC, 47-440 Hz  
1or 2 isolated outputs up to 48 VDC

Class I equipment

- Extremely-wide input voltage range
- Input over- and undervoltage lockout
- Efficient input filter and built-in surge and transient suppression circuitry
- Outputs open- and short-circuit proof
- No derating over entire operating temperature range

Safety according to IEC/EN 60950

## Description

The K Series of DC-DC and AC-DC converters represents a broad and flexible range of power supplies for use in advanced electronic systems. Features include high efficiency, high reliability, low output voltage noise and excellent dynamic response to load/line changes. LK models can be powered by DC or AC with a wide-input frequency range (without PFC).

The converter inputs are protected against surges and transients. An input over- and undervoltage lockout circuitry disables the outputs if the input voltage is outside of the specified range. Certain types include an inrush current limiter preventing circuit breakers and fuses from tripping at switch-on.

All outputs are open- and short-circuit proof and are protected against overvoltages by means of built-in suppressor diodes. The outputs can be inhibited by a logic signal applied to pin 18 (i). If the inhibit function is not used, pin 18 must be connected with pin 14 to enable the outputs.

LED indicators display the status of the converter and allow for visual monitoring of the system at any time.

Full input-to-output, input-to-case, output-to-case and output-to-output isolation is provided. The converters are designed and built according to the international safety standards IEC/EN 60950 and EN50155. They have been approved by the safety agencies TÜV and UL (for USA and Canada).

The case design allows operation at nominal load up to 71 °C in a free-air ambient temperature. If forced cooling is provided, the ambient temperature may exceed 71 °C, but the case temperature must remain below 95 °C under all conditions.

A temperature sensor generates an inhibit signal, which disables the outputs if the case temperature  $T_C$  exceeds the limit. The outputs are automatically re-enabled when the temperature drops below the limit.

Various options are available to adapt the converters to individual applications.

The converters may either be plugged into a 19" rack system according to IEC 60297-3, or be chassis mounted. They are ideally suited for Railway applications.

**Important:** For applications requiring compliance with IEC/EN 61000-3-2 (harmonic distortion), please use our LK4000 and LK5000 Series with incorporated power factor correction (PFC).

<sup>3</sup> Option E available for CK, DK, EK, and LK models; mandatory for all -9 model types.

<sup>4</sup> Option D excludes option V and vice versa; Option V available for K1001 models only.

Example: CK2540-9PD3: DC-DC converter, input voltage range 28 - 140 V, double output, each providing 15 V/5 A, equipped with potentiometer and undervoltage monitoring option. Ambient temperature -40 to 71 °C.

## Product Marking

Basic type designation, applicable approval marks, CE mark, warnings, pin allocation, Power-One patents, and company logo.

Identification of LEDs, test sockets, and potentiometer.

Specific type designation, input voltage range, nominal output voltages and currents, degree of protection, batch no., serial no., and data code including production site, modification status, and date of production.

## Functional Description

The input voltage is fed via an input fuse, an input filter, a bridge rectifier (LK), and an inrush current limiter to the input capacitor. This capacitor sources a single transistor forward converter. Each output is powered by a separate secondary winding of the main transformer. The resultant voltages are rectified and their ripple smoothed by a power choke and output filter. The control logic senses the main output voltage  $V_{O1}$  and generates, with

respect to the maximum admissible output currents, the control signal for the primary switching transistor.

The second output of double-output models is controlled by the main output but has independent current limiting. If the main output is driven into current limitation, the second output voltage will fall as well and vice versa.

## Electrical Input Data

### General Conditions

- $T_A = 25\text{ °C}$ , unless  $T_C$  is specified.
- Pin 18 connected to pin 14, R input not connected,  $V_O$  adjusted to  $V_{O\text{ nom}}$  (option P)
- Sense line pins S+ and S– connected to Vo+ and Vo–, respectively.

Table 2a: Input data

<sup>1</sup> For double output models both outputs loaded with  $I_{O\text{ nom}}$ .

<sup>2</sup> Valid for -7 versions without option E. This is the nominal value at 25 °C and applies to cold models at initial switch-on cycle. Subsequent switch-on/off cycles increase the inrush current peak value.

<sup>3</sup> For 1 s max.

<sup>4</sup> AC operating frequency range is 47 to 440 Hz (440 Hz for 115 V mains). For frequencies  $\geq 63$  Hz refer to *Safety and Installation Instructions*.

## Input Transient Protection

A suppressor diode and/or a VDR (depending on input voltage range) together with the input fuse and a symmetrical input filter form an effective protection against high input transient voltages which typically occur in most installations, but especially in battery-driven mobile applications.

Nominal battery voltages in use are: 12, 24, 36, 48, 60, 72, 110, and 220 V. In most cases each nominal value is specified in a

tolerance of –30% to 25%.

In certain applications, surges according to RIA 12 are specified in addition to those defined in IEC 60571-1. The power supply must not switch off during these surges and since their energy can practically not be absorbed an extremely wide input range is required. The EK input range for 110 V batteries has been designed and tested to meet this requirement.

## Input Fuse

A fuse mounted inside the converter protects the converter against severe defects. This fuse may not fully protect the converter when the input voltage exceeds 200 VDC! In applications where the converters operate at source voltages above 200 VDC an external fuse or a circuit breaker at system level should be installed!

Table 3: Fuse Specification

Model	Fuse type	Reference	Rating
AK <sup>1</sup>	fast-blow	Little fuse 314	30.0 A, 125 V
BK <sup>1</sup>	fast-blow	Little fuse 314	25.0 A, 125 V
CK <sup>2</sup>	slow-blow	SPT	12.5 A, 250 V
DK <sup>2</sup>	slow-blow	SPT	8 A, 250 V
EK <sup>2</sup>	slow-blow	SPT	4 A, 250 V
FK <sup>2</sup>	slow-blow	SPT	16 A, 250 V
LK <sup>2</sup>	slow-blow	SPT	4 A, 250 V

<sup>1</sup> Fuse size 6.3 x 32 mm

<sup>2</sup> Fuse size 5 x 20 mm

## Inrush Current

The CK, DK, EK, and LK models (not -9, not Option E) incorporate an NTC resistor in the input circuitry, which - at initial turn on - reduces the peak inrush current value by a factor of 5 to 10. Subsequent switch-on cycles within short periods increase the inrush current due to the hotter NTC resistor.

Fig. 3  
Typical inrush current versus time at  $V_{i \max}$ ,  $R_{\text{ext}} = 0$ .  
For AK, BK, and FK as well as for application-related values use the formula given in this section to get realistic results.

The inrush current peak value (initial switch-on cycle) can be determined by following calculation:

$$I_{\text{inr p}} = \frac{V_{i \text{ source}}}{(R_{s \text{ ext}} + R_i + R_{\text{NTC}})}$$

Fig. 4  
Equivalent circuit for input impedance

## Static Input Current Characteristic

Fig. 5  
Typical input current versus relative input voltage

## Reverse Polarity

The converters (except LK) are not protected against reverse polarity at the input, but in general, only the input fuse will trip. LK models are fully protected due to the built-in bridge rectifier.

## Input Under-/Overvoltage Lockout

If the input voltage remains below approx.  $0.8 V_{i \min}$  or exceeds approx.  $1.1 V_{i \max}$ , an internally generated inhibit signal disables the output(s). When checking this function the absolute maximum input voltage rating  $V_{i \text{ abs}}$  should be considered! Between  $V_{i \min}$  and the undervoltage lockout level the output voltage may be below the value defined in table: *Electrical Output Data*.

### Hold-up Time Versus Relative Input Voltage

**Fig. 6a**  
Typical hold-up time  $t_h$  versus relative input voltage  $V_i/V_{i \min}$ . The DC-DC converters require an external series diode in the input path if other loads are connected to the same input supply lines.

**Fig. 6b**  
Typical hold-up time  $t_h$  versus relative AC input voltage (LK models)

## Electrical Output Data

General Conditions

–  $T_A = 25\text{ °C}$ , unless  $T_C$  is specified.

– Pin 18 (i) connected to pin 14 (S–/Vo1–),  $V_O$  adjusted to  $V_{O\text{ nom}}$  (option P), R input not connected.

– Sense line pins 12 (S+) and 14 (S–) connected to Vo1+ and Vo1–, respectively.

<sup>1</sup> Same conditions for both outputs.

<sup>2</sup> If the output voltages are increased above  $V_{O \text{ nom}}$  via R-input control, option P setting, remote sensing or option T, the output currents should be reduced accordingly so that  $P_{O \text{ nom}}$  is not exceeded.

<sup>3</sup> Measured according to IEC/EN 61204.

<sup>4</sup> See: *Dynamic Load Regulation*.

<sup>5</sup> For battery chargers a defined negative temperature coefficient can be provided, see *Accessories*.

<sup>6</sup> See: *Output Voltage Regulation of Double Output Models*.

<sup>7</sup> LK models have an additional low-frequency ripple at twice the input frequency (< 5 mV<sub>pp</sub>).

<sup>8</sup> Values for AK.

## Thermal Considerations

If a converter is located in free, quasi-stationary air (convection cooling) at the indicated maximum ambient temperature  $T_{A \max}$  (see table: *Temperature specifications*) and is operated at its nominal input voltage and output power, the temperature measured at the *Measuring point of case temperature*  $T_C$  (see: *Mechanical Data*) will approach the indicated value  $T_{C \max}$  after the warm-up phase. However, the relationship between  $T_A$  and  $T_C$  depends heavily on the conditions of operation and integration into a system. The thermal conditions are influenced by input voltage, output current, airflow and temperature of surrounding components and surfaces.  $T_{A \max}$  is therefore, contrary to  $T_{C \max}$ , an indicative value only.

**Caution:** The installer must ensure that under all operating conditions  $T_C$  remains within the limits stated in the table *Temperature Specifications*.

**Notes:** Sufficient forced cooling or an additional heat sink allows  $T_A$  to be higher than 71 °C (e.g., 85 °C) if  $T_{C \max}$  is not exceeded.

For -7 or -9 models at ambient temperature  $T_A = 85$  °C with only convection cooling; the maximum permissible current for each output is approx. 40% of its nominal value as per the figure below.

**Fig. 7**  
Output current derating versus temperature for -7 and -9 models.

## Thermal Protection

A temperature sensor generates an internal inhibit signal which disables the outputs if the case temperature exceeds  $T_{C \max}$ . The outputs are automatically re-enabled when the temperature drops below this limit.

Continuous operation under simultaneous worst-case conditions of the following three parameters should be avoided: minimum input voltage, maximum output power, and maximum temperature.

## Output Protection

Each output is protected against overvoltages which could occur due to a failure of the internal control circuit. Voltage suppressor diodes (which under worst case condition may become a short circuit) provide the required protection. The suppressor diodes are not designed to withstand externally applied overvoltages. Overload at any of the outputs will cause a shut-down of all outputs. A red LED indicates the overload condition.

## Parallel or Series Connection

Single or double-output models with equal nominal output voltage can be connected in parallel without any precautions using Option T (current sharing).

Single output models and/or main and second outputs of double-output models can be connected in series with any other (similar) output.

### Notes:

- Parallel connection of double output models should include both, main and second output to maintain good regulation of both outputs.
- Not more than 5 models should be connected in parallel.
- Series connection of second outputs without involving their main outputs should be avoided as regulation may be poor.
- Rated output voltages above 36 V need additional measures in order to comply with the safety requirements for SELV (Safe Extra Low Voltage)
- The maximum output current is limited by the output with the lowest current limitation if several outputs are connected in series.

## Output Voltage Regulation

The figure below applies to single-output or double-output models with parallel-connected outputs.

**Fig. 8**  
Output Characteristic  $V_{o1}$  vs.  $I_{o1}$  (typ.)

### Dynamic Load Regulation

Fig. 9  
Typical dynamic load regulation of  $V_O$

Fig. 11  
AK - LK2540:  $\Delta V_{O2}$  (typ.) vs.  $I_{O2}$  with different  $I_{O1}$

### Output Voltage Regulation of Double Output Models

**Note:** If output 2 is not used, we recommend connecting it in parallel with output 1. This ensures good regulation and efficiency.

Output 1 is under normal conditions regulated to  $V_{O1 \text{ nom}}$ .

$V_{O2}$  depends upon the load distribution. If both outputs are loaded with more than 10% of  $I_{O \text{ nom}}$ , the deviation of  $V_{O2}$  remains within  $\pm 5\%$  of the value of  $V_{O1}$ . The following 3 figures show the regulation with varying load distribution.

Two outputs of a K2000 model connected in parallel will behave like the output of a K1000 model.

Fig. 10  
AK - LK2320:  $\Delta V_{O2}$  (typ.) vs.  $I_{O2}$  with different  $I_{O1}$

Fig. 12  
AK - LK2660:  $\Delta V_{O2}$  (typ.) vs.  $I_{O2}$  with different  $I_{O1}$

## Auxiliary Functions

### i Inhibit for Remote On and Off

**Note:** With open i input the output is disabled.

The outputs may be enabled or disabled by means of a logic signal (TTL, CMOS, etc.) applied between the inhibit input i and the negative pin of output 1 (Vo1-). In systems with several models, this feature can be used to control the activation sequence of the converters. If the inhibit function is not required, connect the inhibit pin 18 to pin 14 to enable the outputs (active low logic, fail safe).

Fig. 13  
Definition of  $V_{inh}$  and  $I_{inh}$ .

Table 5: Inhibit characteristics

Characteristic	Conditions	min	typ	max	Unit
$V_{inh}$ Inhibit voltage	$V_o = \text{on}$	$V_{i \min} - V_{i \max}$	-50	0.8	V
	$V_o = \text{off}$		2.4	50	
$I_{inh}$ Inhibit current	$V_{inh} = 0$			-400	$\mu\text{A}$
$t_r$ Rise time			30		ms
$t_f$ Fall time	depending on $I_o$				

Fig. 14  
Typical inhibit current  $I_{inh}$  versus inhibit voltage  $V_{inh}$

Fig. 15  
Typical output response as a function of inhibit control

### Sense Lines

(Only single output models)

**Important:** Sense lines must always be connected! Incorrectly connected sense lines may activate the overvoltage protection, resulting in a permanent short-circuit of the output.

This feature allows for compensation of voltage drops across the connector contacts and if necessary, across the load lines. If the sense lines are connected at the load rather than directly at the connector, the user should ensure that the voltage differences specified in the table below are not exceeded. We recommend connecting the sense lines directly at the female connector.

To ensure correct operation, both sense lines (S+ and S-) should be connected to their respective power outputs (Vo1+ and Vo1-) and the voltage difference between any sense line and its respective power output pin (as measured on the connector) should not exceed the following values:

Table 6: Maximum voltage compensation allowed using sense lines

Output voltage	Total voltage difference between sense lines and their respective outputs	Voltage difference between Vo- and S-
5.1 V	< 0.5 V	< 0.25 V
12, 15, 24 V	< 1.0 V	< 0.25 V

If the output voltages are increased above  $V_{o \text{ nom}}$  via the R-input control, option P setting, remote sensing or option T, the output currents must be reduced accordingly so that  $P_{o \text{ nom}}$  is not exceeded.

### Programmable Output Voltage (R-Function)

As a standard feature, the converters offer an adjustable output voltage, identified by letter R in the type designation. The control input R (pin 16) accepts either a control voltage  $V_{ext}$  or a resistor  $R_{ext}$  to adjust the desired output voltage. When not connected, the control input automatically sets the output voltage to  $V_{O\ nom}$ .

a) Adjustment by means of an external control voltage  $V_{ext}$  between pin 16 (R) and pin 14:

The control voltage range is 0 - 2.75 VDC and allows an output voltage adjustment in the range of approximately 0 - 110%  $V_{O\ nom}$ .

$$V_{ext} = \frac{V_O}{V_{O\ nom}} \cdot 2.5\ V \text{ (approximate formula)}$$

b) Adjustment by means of an external resistor:

Depending upon the value of the required output voltage the resistor shall be connected

**Either:** Between pin 16 and pin 14 ( $V_O < V_{O\ nom}$ ) to achieve an output voltage adjustment range of approximately 0 - 100%  $V_{O\ nom}$

**or:** Between pin 16 and pin 12 ( $V_O > V_{O\ nom}$ ) to achieve an output voltage adjustment range of approximately 100 - 110%  $V_{O\ nom}$ .

#### Warning:

- $V_{ext}$  shall never exceed 2.75 VDC.
- The value of  $R'_{ext}$  shall never be less than the lowest value as indicated in table  $R'_{ext}$  for ( $V_O > V_{O\ nom}$ )

#### Notes:

- The R-Function excludes option P (output voltage adjustment by potentiometer).
- If the output voltages are increased above  $V_{O\ nom}$  via R-input control, option P setting, remote sensing or option T, the output current(s) should be reduced accordingly so that  $P_{O\ nom}$  is not exceeded.
- With double-output models the second output follows the value of the controlled main output.
- In case of parallel connection the output voltages should be individually set within a tolerance of 1 - 2%.

## Display Status of LEDs

Fig. 17

LEDs "OK", "i" and " $I_{oL}$ " status versus input voltage

Conditions:  $I_o \leq I_{o\ nom}$ ,  $T_C \leq T_{C\ max}$ ,  $V_{inh} \leq 0.8\ V$

$V_{i\ uv}$  = undervoltage lockout,  $V_{i\ ov}$  = overvoltage lockout

LEDs "OK" and " $I_{oL}$ " status versus output current

Conditions:  $V_{i\ min} - V_{i\ max}$ ,  $T_C \leq T_{C\ max}$ ,  $V_{inh} \leq 0.8\ V$

LED "i" versus case temperature

Conditions:  $V_{i\ min} - V_{i\ max}$ ,  $I_o \leq I_{o\ nom}$ ,  $V_{inh} \leq 0.8\ V$

LED "i" versus  $V_{inh}$

Conditions:  $V_{i\ min} - V_{i\ max}$ ,  $I_o \leq I_{o\ nom}$ ,  $T_C \leq T_{C\ max}$

## Test Jacks

Test jacks for measuring the main output voltage  $V_{o1}$  are located at the front of the converter. The positive test jack is protected by a series resistor (see: *Functional Description, block diagrams*). The voltage measured at the test jacks is approximately 30 mV lower than the value measured at the output terminals.

## Electromagnetic Compatibility (EMC)

A suppressor diode and/or a metal oxide VDR (depending upon type) together with an input fuse and an input filter form an effective protection against high input transient voltages which

typically occur in most installations; especially in battery-driven mobile applications.

## Electromagnetic Immunity

Table 7: Immunity type tests

Phenomenon	Standard	Surge/ Level	Coupling mode <sup>1</sup>	Value applied	Waveform	Source imped.	Test procedure	In oper.	Per- form.
Supply related surge	RIA 12 (covers also	A <sup>3</sup>	+i/−i	3.5 V <sub>batt</sub>	2/20/2 ms	0.2 Ω	1 positive surge	yes	A

<sup>1</sup> Overtemperature lockout at T<sub>C</sub> > 95 °C

## Failure Rates

Table 10: MTBF

Values at specified case temperature	Model types	Ground benign 40 °C	Ground fixed 40 °C	70 °C	Ground mobile 50 °C	Unit
MTBF <sup>1</sup>	AK - LK	700 000	160 000	85 000	60 000	h
Device hours <sup>2</sup>		500 000				

<sup>1</sup> Calculated in accordance with MIL-HDBK-217F-N2 (LK2660-7).

<sup>2</sup> Statistical values, based on an average of 4300 working hours per year and over 3 years in general field use.

## Mechanical Data

Dimensions in mm. The converters are designed to be inserted into a 19" rack, 160 mm long, according to IEC 60297-3.

09002\_051006

**Fig. 19**  
Case K02 with heat sink, case aluminium, black finish and self-cooling, weight: Approx. 1.55 kg

### Note:

- $d \geq 15$  mm, recommended clearance to next part in order to ensure proper air circulation at full power.
- Free air location: the converter should be mounted with fins in a vertical position to achieve maximum airflow through the heat sink.

Fig. 20

Case K02 with option B1 (cooling plate), case aluminium, black finish and self cooling, weight: Approx. 1.15 kg

**Note:** Long case with S-type heat sink or cooling plate B2, elongated by 60 mm for 220 mm rack depth, is available on request. (No LEDs and no test jacks.) These models are assigned a customer-specific part number by Power-One.

## Safety and Installation Instructions

### Connector Pin Allocation

The connector pin allocation table defines the electrical

potentials and the physical pin positions on the H15/H15 S4 connector. Pin no. 24 (protective earth) is a leading pin, ensuring that it makes contact first.

Fig. 21  
View of converter's male connectors

Table 11: H15 and H15 S4 connector pin allocation

Pin No.	Connector type H15 S4				Connector type H 15

<sup>1</sup> Not connected, if option P is fitted.

<sup>2</sup> Leading pin.

<sup>3</sup> Option D excludes option V and vice versa.

<sup>4</sup> LK models.

<sup>5</sup> Not connected, if none of the options D, T, or V are fitted.

### Installation Instructions

The K Series converters are components, intended exclusively for inclusion within other equipment by an industrial assembly operation or by professional installers. Installation must strictly follow the national safety regulations in compliance with the enclosure, mounting, creepage, clearance, casualty, markings and segregation requirements of the end-use application.

Connection to the system shall be made via the female connector H15/H15 S4 (see: *Accessories*). Other installation methods may not meet the safety requirements.

The converters are provided with pin 24 (⊕), which is reliably

connected with the case. For safety reasons it is essential to connect this pin to protective earth. See: *Safety of Operator-Accessible Output Circuit*.

Input pins 30 and 32 are internally fused. Since this fuse is designed to protect the converter in case of an overcurrent and does not necessarily cover all customer needs, an external fuse suitable for the application and in compliance with the local requirements might be necessary in the wiring to one or both input potentials, pins 26 and 28, and/or 30 and 32.

**Important:** When the inhibit function is not in use, pin no. 18 (i) should be connected to pin no. 14 (S-/Vo1-) to enable the output(s). Do not open the converters, or guarantee will be invalidated.

Due to high current values, some models provide two internally parallel connected contacts for certain paths (pins 4/6, 8/10, 26/28 and 30/32). It is recommended to connect load and supply to both female connector pins of each path in order to keep the voltage drop across the connector pins at an absolute minimum and to avoid overstress of the connector contacts with currents higher than 8 A.

Make sure that there is sufficient air flow possible for convection cooling. This should be verified by measuring the case temperature when the converter is installed and operated in the end-use application. The maximum specified case temperature  $T_{Cmax}$  shall not be exceeded. See also *Thermal Considerations*.

If the end-product is to be UL certified, the temperature of the main isolation transformer should be evaluated as part of the end-product investigation.

Check for hazardous voltages before altering any connections.

Ensure that a converter failure (e.g., by an internal short-circuit) does not result in a hazardous condition. See also: *Safety of Operator Accessible Output Circuits*.

#### LK-models Operated at Greater than 63 Hz

Above 63 Hz the earth leakage current may exceed 3.5 mA, the maximum specified in IEC/EN 60950. The built-in Y-caps are only approved for  $\leq 100$  Hz. Frequencies greater than 350 Hz are only permitted for  $V_i \leq 200$  VAC.

#### Isolation

The electric strength test is performed in the factory as routine test in accordance with EN 50116, IEC/EN 60950 and UL 1950 and should not be repeated in the field. Power-One will not honor any guarantee claims resulting from electric strength field tests.

Table 12: Leakage Currents for LK-models

Characteristic		Class I LK1000, LK2000	Unit
Maximum earth leakage current	Permissible according to IEC/EN 60950	3.5	mA
	Specified value at 264 V, 50 Hz	1.43	

Table 13: Isolation

Characteristic		Input to case + output(s)	Output to case	Output to output	Unit
Electric strength test voltage	Factory test 1 s	2.8 <sup>1</sup>	1.4	0.14	kVDC
	AC test voltage equivalent to factory test	2.0	1.0	0.1	kVAC
Insulation resistance at 500 VDC		300 <sup>2</sup>	300 <sup>2</sup>	100	MΩ

<sup>1</sup> In accordance with EN 50116 and IEC/EN 60950 subassemblies are pretested with 5.6 kVDC.

<sup>2</sup> Tested at 500 VDC.

#### Standards and Approvals

The converters are UL recognized according to UL 1950, for Canada to CAN/CSA C22.2 No. 950-95, and TÜV approved to IEC/EN 60950 standards.

The converters correspond to Class I equipment and have been evaluated for:

- Building in,
- Basic insulation between input and case based on 250 V and double or reinforced insulation or an earthed part between input and output.
- The use in a pollution degree 2 environment,
- Connecting the input to a primary or secondary circuit which is subject to a maximum transient rating of 2500 V.

The converters are subject to manufacturing surveillance in accordance with the above mentioned UL and ISO 9001:2000 standards.

#### Railway Applications

The K Series converters have been designed according to the Railway Standards EN50155 and EN50121. All boards and components are coated with a protective lacquer.

#### Cleaning Agents

In order to avoid possible damage, any penetration of cleaning fluids must be prevented, since the power supplies are not hermetically sealed.

#### Protection Degree

Condition: Female connector fitted to the converter.

IP 30: All models except those with option P and option D, or V with potentiometer.

IP 20: All models exhibiting a potentiometer.

### Safety of Operator-Accessible Output Circuits

If the output circuit of a DC-DC converter is operator-accessible, it shall be a SELV circuit according to safety standard IEC/EN 60950.

The following table shows some possible installation configurations, compliance with which causes the output circuit

of a DC-DC converter to be a SELV circuit according to IEC/EN 60950 up to a configured output voltage (sum of nominal voltages if in series or +/- configuration) of 36 V.

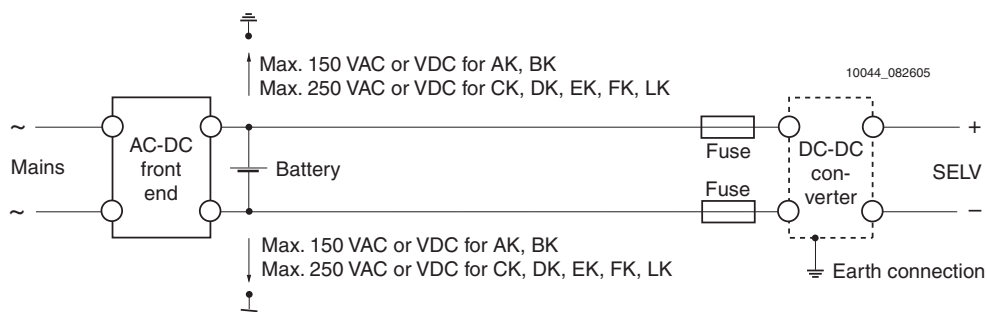

Fig. 22

Schematic safety concept.

Use earth connection as per the table below.

Table 14: Safety concept leading to a SELV output circuit

Conditions	Front end		Result	DC-DC converter		Result
Nominal supply voltage	Minimum required grade of insulation, to be provided by the AC-DC front end, including mains supplied battery charger	DC output voltage from the front end	Minimum required safety status of the front end output circuit	Types	Measures to achieve the specified safety status of the output circuit	Safety status of the DC-DC converter output circuit
Mains $\leq 150$ VAC	Functional (no electrical insulation between the mains supply voltage and the DC-DC converter input)	$\leq 100$ V. The nominal voltage between any output pin and earth is $\leq 150$ V (AC or DC)	Primary circuit	AK BK	a) Double or reinforced insulation based on the mains voltage (provided by the DC-DC converter) AND b) earthed case <sup>3</sup>	SELV circuit
Mains $\leq 250$ VAC		$\leq 250$ V The nominal voltage between any output pin and earth is $\leq 250$ V (AC or DC)		CK DK EK FK		
	Basic	$\leq 250$ V	Unearthed hazardous voltage secondary circuit	AK BK CK DK EK FK	a) Supplementary insulation, based on 250 VAC AND b) double or reinforced insulation <sup>2</sup> (provided by DC-DC converter) AND c) earthed case <sup>3</sup>	
			Earthed hazardous voltage secondary circuit		a) Double or reinforced insulation <sup>2</sup> (provided by the DC-DC converter) AND b) earthed case <sup>3</sup>	
	Double or reinforced	$\leq 60$ V	SELV circuit		<sup>4</sup>	
		$\leq 120$ V	TNV-3 circuit		Basic insulation (provided by the DC-DC converter) <sup>4</sup>	

<sup>1</sup> The front end output voltage should match the specified input voltage range of the DC-DC converter.

<sup>2</sup> Based on the maximum nominal output voltage from the front end.

<sup>3</sup> The earth connection has to be provided by the installer according to the relevant safety standards, e.g. IEC/EN 60950.

<sup>4</sup> Earthing of the case is recommended, but not mandatory.

If the output circuit of a AC-DC converter is operator-accessible, it shall be a SELV circuit according to the related IEC/EN 60950 safety standards.

The following table shows a possible installation configuration, compliance with which causes the output circuit of an LK Series AC-DC converter to be a SELV circuit according to IEC/EN

60950 up to a configured output voltage (sum of nominal voltages if in series or +/– configuration) of 36 V.

If the LK converters are used as DC-DC converters, please refer to the previous section.

*Table 15: Safety concept leading to an SELV output circuit*

Conditions	AC-DC converter	Installation	Result
Nominal voltage	Grade of insulation between input and output provided by the AC-DC converter	Measures to achieve the resulting safety status of the output circuit	Safety status of the AC-DC converter output circuit
Mains ≤250 VAC	Double or reinforced	Earthed case <sup>1</sup> and installation according to the applicable standards	SELV circuit

<sup>1</sup> The earth connection has to be provided by the installer according to the relevant safety standards, e.g. IEC/EN 60950.

*Fig. 23*

*Schematic safety concept. Use fuses and earth connection as per: Installation Instructions and table: Safety concept leading to a SELV output circuit.*

## Description of Options

Table 16: Survey of options

Option	Function of Option	Characteristics
-9	Extended operational ambient temperature range	$T_A = -40$ to $71$ °C
E	Electronic inrush current limitation circuitry	Active inrush current limitation for CK, DK, EK
P	Potentiometer for fine adjustment of output voltage	Adjustment range +10/-60% of $V_{O\ nom}$ (R input not connected)
D <sup>1</sup>	Input and/or output undervoltage monitoring circuitry	Safe data signal output (versions D0 - DD)
V <sup>1,2</sup>	Input (and output) undervoltage monitoring circuitry	ACFAIL signal according to VME specs (versions V0, V2, V3)
T	Current sharing	Interconnect T-pins if paralleling outputs (5 models max.)
B1/B2	Cooling plate	Replaces standard heat sink, allowing direct chassis-mounting

<sup>1</sup> Option D excludes Option V and vice versa.

<sup>2</sup> Only available for  $V_{O1} = 5.1$  V.

### Option -9: Extended Temperature Range

Option -9 extends the operational ambient temperature range from  $-25$  to  $71$  °C to  $-40$  to  $71$  °C. The power supplies provide full nominal output power with convection cooling. Option -9 excludes inrush current limitation by NTC.

### Option E: Inrush Current Limiter

CK/DK/EK/LK models may be supplemented by an electronic circuit (option E, replacing the standard built-in NTC) to achieve an enhanced inrush current limiting function. Option E is mandatory for -9 models.

CK models fitted with option E and option D6 (input voltage monitoring) meet the standard ETS 300132-2 for 48 VDC supply voltage. Option D6 (externally adjustable via potentiometer from 36.0 to 40.5 V) is necessary to disable the converter at low input voltages, avoiding an excessive input current. Option D6 threshold level should be adjusted to 44.0 - 50.0 V for 60 V nominal supply systems (refer to the description of option D). The D output can be connected directly to the inhibit input.

Table 17: Inrush current characteristics with option E (DC-DC converters)

Characteristics		CK	DK	EK	Unit
$V_{i\ nom}, I_{o\ nom}$	Input voltage	60	110	220	V
$I_{inr\ p}$	Peak inrush current	6.8	7.4	14.6	A
$t_{inr}$	Inrush current duration	18	14	16	ms
$V_{i\ max}, I_{o\ nom}$	Input voltage	140	220	380	V
$I_{inr\ p}$	Peak inrush current	9.3	14.5	25.3	A
$t_{inr}$	Inrush current duration	20	14	12	ms

**Note:** Subsequent switch-on cycles at startup are limited to max. 10 cycles during the first 20 seconds (cold model) and then to max. 1 cycle every 8 seconds.

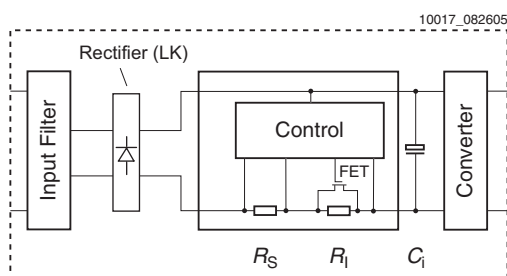

Fig. 24  
Option E block diagram

Current limiting resistance =  $R_S + R_L = 15$  Ω (all models)

Fig. 25  
Inrush current with option E (DC-DC converters)

Table 18: Inrush current characteristics with option E (AC-DC converters)

Characteristics $V = 230 \text{ VAC}$		min	LK typ	max	Unit
$I_{\text{inr p}}$	Peak inrush current	—	—	21.7	A
$t_{\text{inr}}$	Inrush current duration	—	35	50	ms

Fig. 26  
Inrush current with option E  
(LK models,  $V_i = 230 \text{ VAC}$ ,  $f_i = 50 \text{ Hz}$ ,  $P_O = P_{O \text{ nom}}$ )

### Option P: Potentiometer

The potentiometer allows for an output voltage adjustment in the range of +10/-60% of  $V_{O\text{ nom}}$ . It is accessible through a hole in the front cover. This feature enables compensation of voltage drops across the connector and wiring. Option P is not recommended if models are connected in parallel.

In double-output models both outputs are influenced by the potentiometer setting. If option P is fitted, the R-pin 16 is not connected.

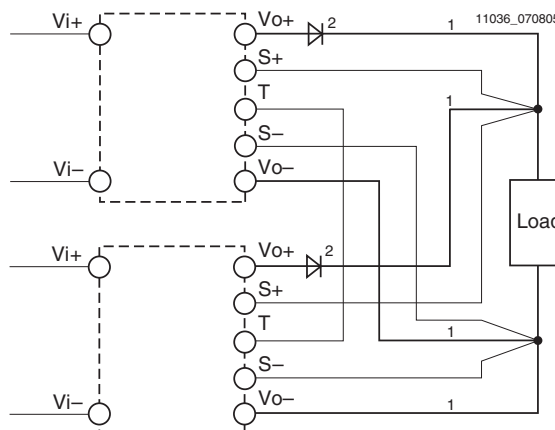

**Note:** If the output voltage is increased above  $V_{O\text{ nom}}$  via the R-input control, option P setting, remote sensing, or option T, the output current(s) should be reduced accordingly so that  $P_{O\text{ nom}}$  is not exceeded.

### Option T: Current Sharing

This option ensures that the output currents are approximately shared between all paralleled converters, hence increasing system reliability. To use this facility, simply interconnect the T pins of all converters and make sure, that the reference pins for the T-pin (S- for the K1000 or  $V_{O1-}$  for K2000) are also connected together. The load lines should have equal length and cross section to ensure equal voltage drops. Not more than 5 converters should be connected in parallel. The R-pins should be left in an open-circuit condition. If not, prior to paralleling the  $V_{O1}$  outputs should be individually adjusted within 1 to 2%. Parallel connection of converters with option P is not recommended.

**Fig. 27**  
An example of poor wiring for connections in parallel (unequal length of load lines)

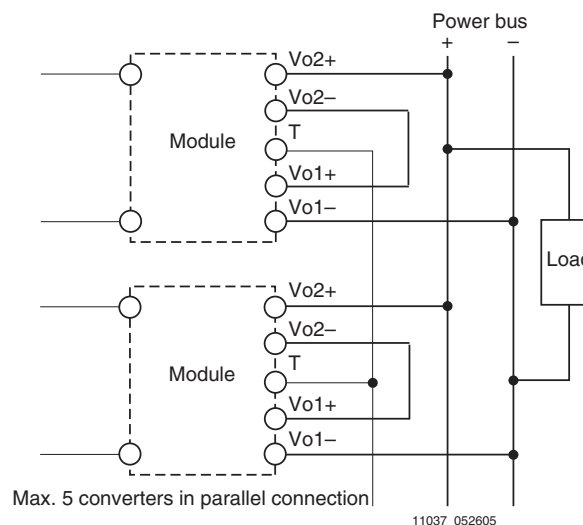

Max. 5 converters in parallel connection

<sup>1</sup> Leads should have equal length and cross sections and should run in the same cable loom.

<sup>2</sup> Diodes for redundant operation.

**Fig. 28**  
Paralleling of single-output models using option T with the sense lines connected at the load

**Fig. 29**  
Paralleling of double output models with the outputs connected in series, and using option T in an application with a power bus. Note that the signal at the T-pins is referenced to  $V_{O1-}$ .

#### Option D: Undervoltage Monitor

The input and/or output undervoltage monitoring circuit operates independently of the built-in input undervoltage lockout circuit. A logic "low" (JFET output) or "high" signal (NPN output) is generated at pin 20 as soon as one of the monitored voltages drops below the preselected threshold level  $V_t$ . The return for this signal is Vo1-. The D output recovers when the monitored voltage(s) exceed(s)  $V_t + V_h$ . The threshold levels  $V_{ti}$  and  $V_{to}$

are either adjustable by a potentiometer, accessible through a hole in the front cover, or factory adjusted to a fixed value specified by the customer.

Option D exists in various versions D0 - DD as shown in the following table.

Table 19: Undervoltage monitor functions

Output type		Monitoring		Minimum adjustment range of threshold level $V_t$		Typical hysteresis $V_h$ [% of $V_t$ ] for $V_{t \min} - V_{t \max}$	
JFET	NPN	$V_i$	$V_{o1}$	$V_{ti}$	$V_{to}$	$V_{hi}$	$V_{ho}$
D1	D5	no	yes	-	3.5 - 40 V <sup>1</sup>	-	2.5 - 0.6
D2	D6	yes	no	$V_{i \min} - V_{i \max}$ <sup>1</sup>	-	3.4 - 0.4	-
D3	D7	yes	yes	$V_{i \min} - V_{i \max}$ <sup>1</sup>	$(0.95 - 0.985 V_{o1})$ <sup>2</sup>	3.4 - 0.4	"0"
D4	D8	no	yes	-	$(0.95 - 0.985 V_{o1})$ <sup>2</sup>	-	"0"
D0	D9	no	yes	-	3.5 - 40 V <sup>3</sup>	-	2.5 - 0.6
		yes	no	$V_{i \min} - V_{i \max}$ <sup>3,4</sup>	3.4 - 0.4	-	
		yes	yes	$V_{i \min} - V_{i \max}$ <sup>3,4</sup>	3.5 - 40 V <sup>3</sup>	3.4 - 0.4	2.5 - 0.6
		yes	yes	$V_{i \min} - V_{i \max}$ <sup>3,4</sup>	$(0.95 - 0.985 V_{o1})$ <sup>2</sup>	3.4 - 0.4	"0"
-	DD	yes	yes	$V_{i \min} - V_{i \max}$ <sup>1</sup>	3.5 - 40 V <sup>1</sup>	3.4 - 0.4	2.5 - 0.6

<sup>1</sup> Threshold level adjustable by potentiometer

<sup>2</sup> Fixed value tracking if  $V_{o1}$  is adjusted via R-input, option P or sense lines.

<sup>3</sup> The threshold level is permanently adjusted according to customer specification  $\pm 2\%$  at 25 °C. Any value within the specified range is possible, but causes a new customer-specific type designation.

<sup>4</sup> Adjusted at  $I_o \text{ nom}$

#### JFET output (D0 - D4):

Pin 20 (D) is internally connected via the drain-source path of a JFET (self-conducting type) to Vo1+ or Vo+.  $V_D \leq 0.4$  V (logic low) corresponds to a monitored voltage level ( $V_i$  and/or  $V_{O1}$ )  $< V_t$ . The current  $I_D$  through the JFET should not exceed 2.5 mA. The JFET is protected by a 0.5 W Zener diode of 8.2 V against external overvoltages.

$V_i, V_{O1}$ status	D output, $V_D$
$V_i$ or $V_{O1} < V_t$	low, L, $V_D \leq 0.4$ V at $I_D = 2.5$ mA
$V_i$ and $V_{O1} > V_t + V_h$	high, H, $I_D \leq 25$ $\mu$ A at $V_D = 5.25$ V

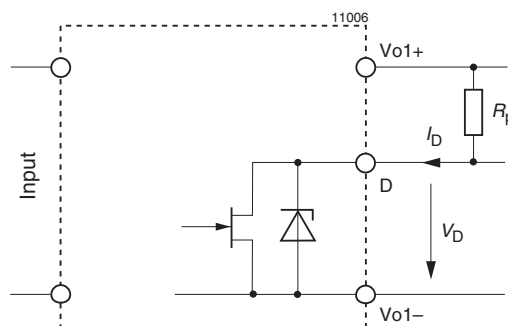

Fig. 30  
Option D1 - D0: JFET output,  $I_D \leq 2.5$  mA

#### NPN output (D5 - DD):

Pin 20 (D) is internally connected via the collector-emitter path of an NPN transistor to Vo1+ or Vo+.  $V_D < 0.4$  V (logic low) corresponds to a monitored voltage level ( $V_i$  and/or  $V_{O1}$ )  $> V_t + V_h$ . The current  $I_D$  through pin 20 should not exceed 20 mA. This output is not protected against external overvoltages.  $V_D$  should not exceed 40 V.

$V_i, V_{O1}$ status	D output, $V_D$
$V_i$ or $V_{O1} < V_t$	high, H, $I_D \leq 25$ $\mu$ A at $V_D = 40$ V
$V_i$ and $V_{O1} > V_t + V_h$	low, L, $V_D \leq 0.4$ V at $I_D = 20$ mA

Fig. 31  
Option D5 - DD: NPN output,  $V_{O1} \leq 40$  V,  $I_D \leq 20$  mA

Table 20: D-output logic signals

Version of D	$V_i < V_t$ resp. $V_O < V_t$	$V_i > V_t + V_h$ resp. $V_O > V_t$	Configuration
D1, D2, D3, D4, D0	low	high	JFET
D5, D6, D7, D8, D9, DD	high	low	NPN

#### Threshold tolerances and hysteresis:

If  $V_i$  is monitored, the internal input voltage after the input filter is measured. Consequently, this voltage differs from the voltage at the connector pins by the voltage drop  $\Delta V_{ti}$  across the input filter. The threshold levels of the D0 and D9 options are factory-adjusted at nominal output current  $I_{O\text{ nom}}$  and at  $T_A = 25$  °C. The value of  $\Delta V_{ti}$  depends upon the input voltage range (CK, DK, ..), threshold level  $V_t$ , temperature and input current. The input current is a function of the input voltage and the output power.

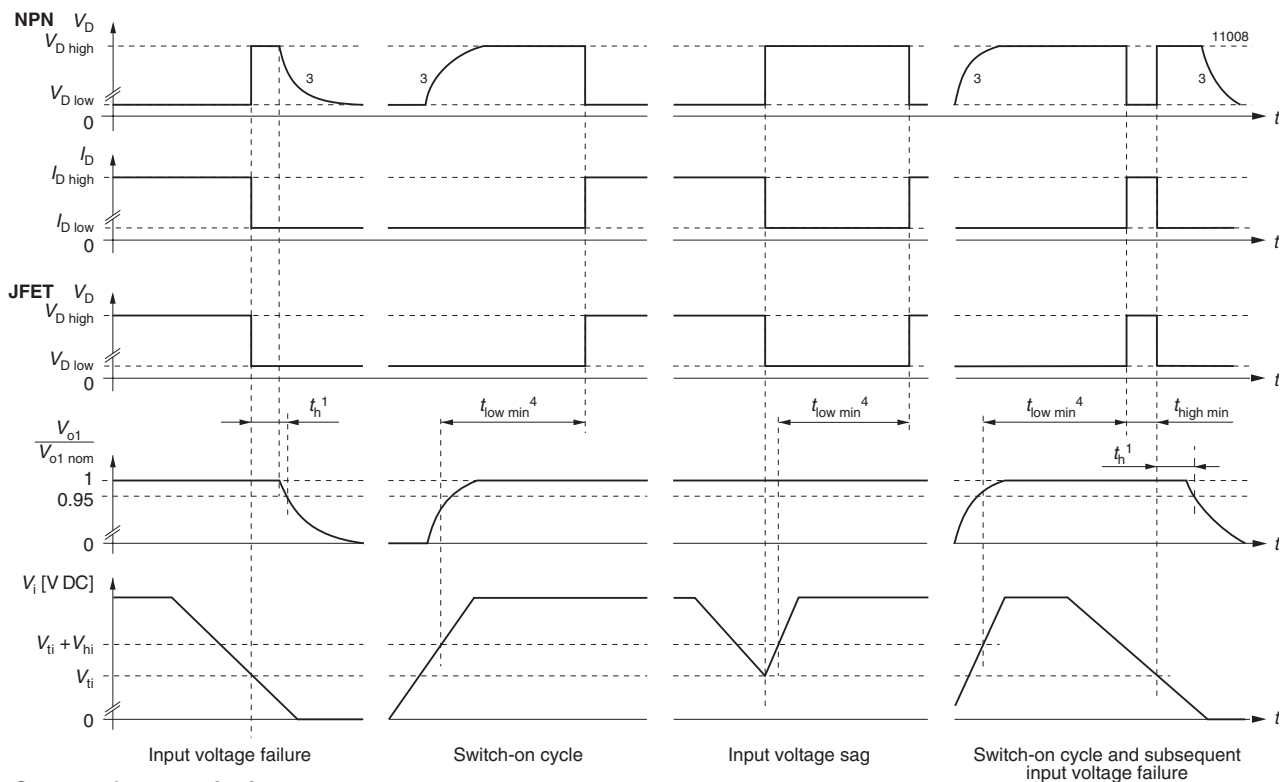

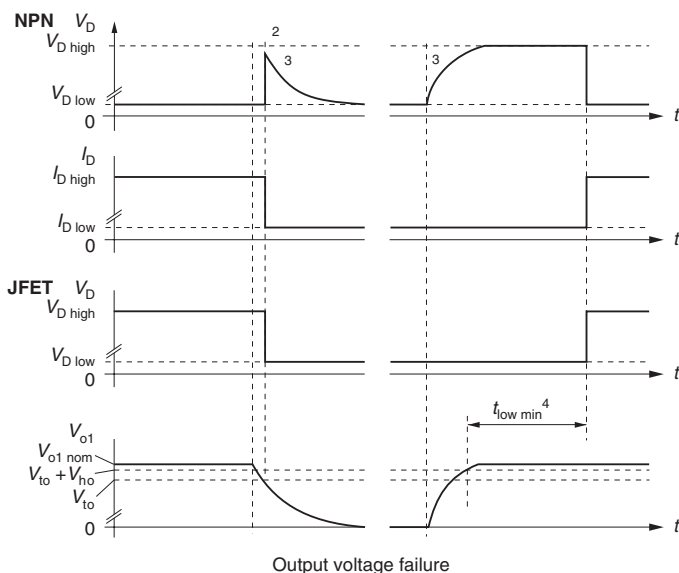

Fig. 32  
Definition of  $V_{ti}$ ,  $\Delta V_{ti}$  and  $\Delta V_{hi}$  (JFET output)

D-signal with respect to input and output voltage versus time:

### Input voltage monitoring

### Output voltage monitoring

**Fig. 33**  
Relationship between  $V_i$ ,  $V_{o1}$ ,  $V_D$ ,  $V_{o1}/V_o\text{ nom}$  versus time

<sup>1</sup> Hold-up time see *Electrical Input Data*

<sup>2</sup> With output voltage monitoring, hold-up time  $t_h = 0$ .

<sup>3</sup> The signal will remain high if the D output is connected to an external source.

<sup>4</sup>  $t_{\text{low min}}$  = typically 130 ms.

### Option V: ACFAIL signal (VME)

Available only for models with  $V_O = 5.1$  V.

This option defines an undervoltage monitoring circuit for the input and main output voltage. It generates an ACFAIL signal (V signal) which conforms to the VME standard.

The low state level of the ACFAIL signal is specified at a sink current of  $I_V \leq 48$  mA to  $V_V \leq 0.6$  V (open-collector output of an NPN transistor). The pull-up resistor feeding the open-collector output should be placed on the VME backplane.

After the ACFAIL signal has gone low, the VME standard requires a hold-up time ( $t_h$ ) of at least 4 ms before the 5.1 V output drops to 4.875 V when the output is fully loaded. The hold-up time is provided by the internal input capacitance. Consequently, the working input voltage and the threshold level ( $V_{ti}$ ) should be adequately above the minimum input voltage ( $V_{i \min}$ ) of the converter so that enough energy is remaining in the input capacitance. If the input voltage is below the required level, an external hold-up capacitor ( $C_{i \text{ ext}}$ ) should be added.

Formula for threshold level for desired value of  $t_h$ :

$$V_{ti} = \sqrt{\frac{2 \cdot P_O \cdot (t_h + 0.3 \text{ ms}) \cdot 100}{C_{i \min} \cdot \eta}} + V_{i \min}^2$$

Formula for the external input capacitor:

$$C_{i \text{ ext}} = \frac{2 \cdot P_O \cdot (t_h + 0.3 \text{ ms}) \cdot 100}{\eta \cdot (V_{ti}^2 - V_{i \min}^2)} - C_{i \min}$$

where as:

$C_{i \min}$  = internal input capacitance [mF]

$C_{i \text{ ext}}$  = external input capacitance [mF]

$P_O$  = output power [W]

$\eta$  = efficiency [%]

$t_h$  = hold-up time [ms]

$V_{i \min}$  = minimum input voltage [V] <sup>1</sup>

$V_{ti}$  = threshold level [V]

<sup>1</sup> Min. input voltage according to *Electrical Input Data*. For output voltages  $V_O > V_{O \text{ nom}}$ , the minimum input voltage increases proportionally to  $V_O/V_{O \text{ nom}}$ .

Remarks:

Option V2 and V3 can be adjusted by potentiometer to a threshold level between  $V_{i \min}$  and  $V_{i \max}$ . A decoupling diode should be connected in series with the input of AK - FK converters to avoid the input capacitance discharging through other loads connected to the same source voltage.

Table 21: Available internal input capacitance and factory potentiometer setting of  $V_{ti}$  with resulting hold-up time

Types	AK	BK	FK	CK	DK	EK	LK	Unit
$C_{i \min}$	0.83	0.3	1.2	0.66	0.26	0.21	0.21	mF
$V_{ti}$	9.5	19.5	39	39	61	97	120	VDC
$t_h$	0.1	0.1	3.4	1.1	1.1	2.7	4.2	ms

Option V operates independently of the built-in input undervoltage lockout circuit. A logic "low" signal is generated at pin 20 as soon as one of the monitored voltages drops below the preselected threshold level  $V_t$ . The return for this signal is Vo1-. The V output recovers when the monitored voltage(s) exceed(s)

$V_t + V_h$ . The threshold level  $V_{ti}$  is either adjustable by potentiometer, accessible through a hole in the front cover, or adjusted during manufacture to a determined customer specified value.

Versions V0, V2, and V3 are available as shown below.

Table 22: Undervoltage monitor functions

V output (VME compatible)	Monitoring		Minimum adjustment range of threshold level $V_t$		Typical hysteresis $V_h$ [% of $V_t$ ] for $V_{t \min} - V_{t \max}$	
	$V_i$	$V_{O1}$	$V_{ti}$	$V_{to}$	$V_{hi}$	$V_{ho}$
V2	yes	no	$V_{i \min} - V_{i \max}^1$	—	3.4 - 0.4	—
V3	yes	yes	$V_{i \min} - V_{i \max}^1$	$0.95 - 0.985 V_{O1}^2$	3.4 - 0.4	"0"
V0	yes	no	$V_{i \min} - V_{i \max}^{3,4}$	—	3.4 - 0.4	—
	yes	yes	$V_{i \min} - V_{i \max}^{3,4}$	$0.95 - 0.985 V_{O1}^2$	3.4 - 0.4	"0"

<sup>1</sup> Threshold level adjustable by potentiometer.

<sup>2</sup> Fixed value between 95% and 98.5% of  $V_{O1}$  (tracking).

<sup>3</sup> Adjusted at  $I_{O \text{ nom}}$ .

<sup>4</sup> Fixed value, resistor-adjusted ( $\pm 2\%$  at 25 °C) acc. to customer's specifications; individual type number is determined by Power-One.

#### V output (V0, V2, V3):

Connector pin V is internally connected to the open collector of an NPN transistor. The emitter is connected to Vo1- or Vo-.  $V_V \leq 0.6$  V (logic low) corresponds to a monitored voltage level ( $V_i$  and/or  $V_{o1}$ )  $< V_t$ . The current  $I_V$  through the open collector should not exceed 50 mA. The NPN output is not protected against external overvoltages.  $V_V$  should not exceed 60 V.

$V_i, V_{o1}$ status	V output, $V_V$
$V_i$ or $V_{o1} < V_t$	low, L, $V_V \leq 0.6$ V at $I_V = 50$ mA
$V_i$ and $V_{o1} > V_t + V_h$	high, H, $I_V \leq 25$ $\mu$ A at $V_V = 5.1$ V

#### Threshold tolerances and hysteresis:

If  $V_i$  is monitored, the internal input voltage is measured after the input filter. Consequently, this voltage differs from the voltage at the connector pins by the voltage drop  $\Delta V_{ti}$  across the input filter. The threshold level of option V0 is adjusted during manufacture at  $I_o$  nom and  $T_A = 25$  °C. The value of  $\Delta V_{ti}$  depends upon the input voltage range (AK, BK, etc.), threshold level  $V_t$ , temperature and input current. The input current is a function of input voltage and output power.

Fig. 34  
Output configuration of options V0, V2, and V3

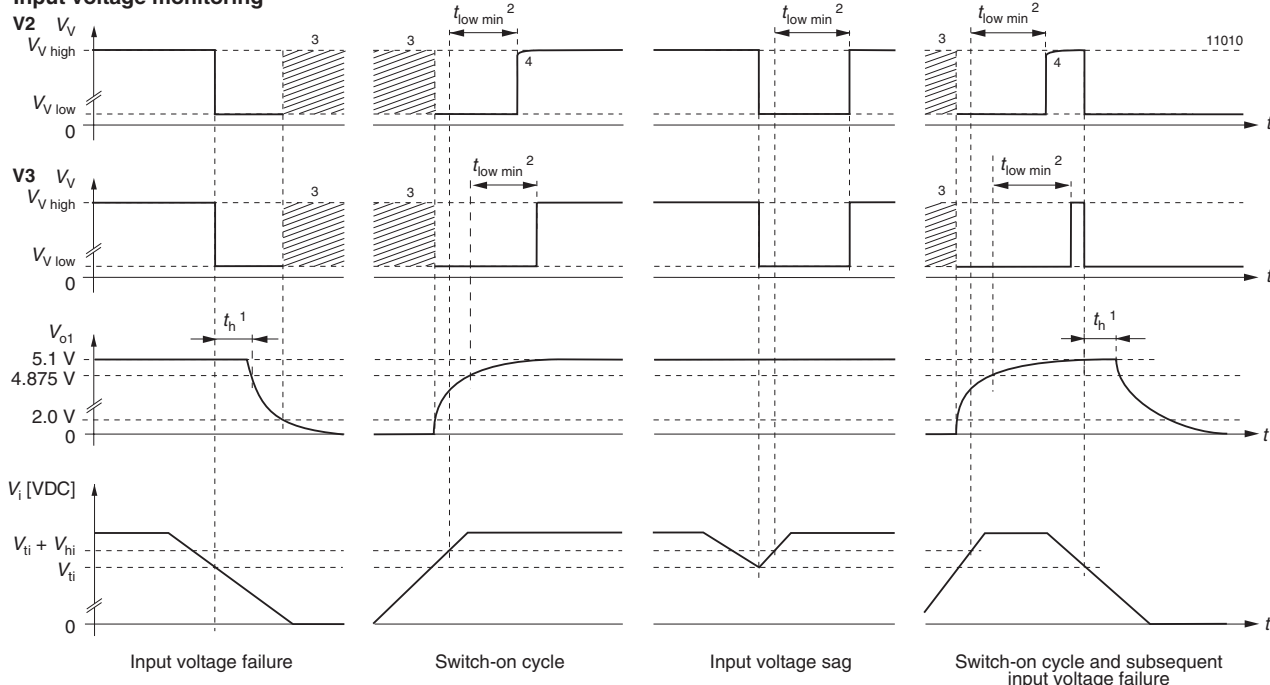

Fig. 35  
Definition of  $V_{ti}$ ,  $\Delta V_{ti}$  and  $V_{hi}$

### Input voltage monitoring

### Output voltage monitoring

<sup>1</sup> VME request: minimum 4 ms

<sup>2</sup>  $t_{low\ min} = 40 - 200$  ms, typically 80 ms

<sup>3</sup>  $V_V$  level not defined at  $V_{O1} < 2.0$  V

<sup>4</sup> The V signal drops simultaneously with the output voltage. If the pull-up resistor  $R_P$  is connected to  $V_{O1+}$ . The V signal remains high if  $R_P$  is connected to an external source.

**Fig. 36**  
Relationship between  $V_i$ ,  $V_{O1}$ ,  $V_V$ ,  $I_V$  and  $V_{O1}/V_{O\ nom}$  versus time.

### Options B1/B2: Cooling Plate

Where a cooling surface is available, we recommend the use of a cooling plate (option B1) instead of the standard heat sink. The mounting system should ensure sufficient cooling capacity to guarantee that the maximum case temperature  $T_{C\ max}$  is not exceeded. The cooling capacity is calculated by:

$$P_{Loss} = \frac{(100\% - \eta)}{\eta} \cdot V_O \cdot I_O$$

Efficiency  $\eta$  see: *Model Selection*

Elongated case for 220 mm rack depth: Option B2

Dimensions see *Mechanical Data*

## Accessories

A variety of electrical and mechanical accessories are available including:

- Front panels for 19" DIN-rack: Schroff 16 TE /3U, [HZZ00831] and 16 TE /6U [HZZ00832], or Intermax 16 TE /3U [HZZ00731].
- Mating H15/H15 S4 connectors with screw, solder, fast-on or press-fit terminals.
- Cable connector housing: Screw version [HZZ00141] or retention clip version [HZZ00142].
- Connector retention clips (2x) [HZZ01209].
- Connector retention brackets CRB [HZZ01216].
- Coding clips for connector coding [HZZ00202].
- DIN-rail mounting assembly DMB-K/S [HZZ00615].
- Wall-mounting plate K02 [HZZ01213] for models with Option B1.
- Additional external input or output filters.
- Battery temperature sensor [S-KSMH...] for use of the converter as a battery charger. Different battery characteristics can be selected.

**For additional accessory product information, see the accessory data sheets listed with each product series or individually at [www.power-one.com](http://www.power-one.com) through the following menus: "Select Products", "Download Data Sheets & Applications Notes", or with each model in the product overviews.**

**NUCLEAR AND MEDICAL APPLICATIONS** - Power-One products are not designed, intended for use in, or authorized for use as critical components in life support systems, equipment used in hazardous environments, or nuclear control systems without the express written consent of the respective divisional president of Power-One, Inc.

**TECHNICAL REVISIONS** - The appearance of products, including safety agency certifications pictured on labels, may change depending on the date manufactured. Specifications are subject to change without notice.

## EC Declaration of Conformity

We

Power-One AG  
Ackerstrasse 56, CH-8610 Uster

declare under our sole responsibility that K and S Series AC-DC and DC-DC converters carrying the CE-mark are in conformity with the provisions of the Low Voltage Directive (LVD) 73/23/EEC of the European Communities.

Conformity with the directive is presumed by conformity with the following harmonized standards:

- EN 61204:1995 (= IEC 61204:1993, modified)  
Low-voltage power supply devices, DC output - Performance characteristics and safety requirements
- EN 60950:2000 (= IEC 60950:2000)  
Safety of information technology equipment

The installation instructions given in the data sheet describe correct installation leading to the presumption of conformity of the end product with the LVD. All K and S Series AC-DC and DC-DC converters are components, intended exclusively for inclusion within other equipment by an industrial assembly operation or by professional installers. They must not be operated as stand alone products.

Hence conformity with the Electromagnetic Compatibility Directive 89/336/EEC (EMC Directive) needs not to be declared. Nevertheless, guidance is provided in most product application notes on how conformity of the end product with the indicated EMC standards under the responsibility of the installer can be achieved, from which conformity with the EMC directive can be presumed.
