

LM3743 Evaluation Board

National Semiconductor
Application Note 1450
Ricardo Capetillo
September 2006

Introduction

The LM3743 is a voltage mode PWM buck controller which implements synchronous rectification. It provides a low cost, fault tolerant, and efficient point of load solution. To reduce component count several parameters are fixed, such as switching frequency and the short circuit protection level. In steady state operation the LM3743 is always synchronous, even at no load, thus simplifying the compensation design. The LM3743 ensures a smooth and controlled start-up when the output is pre-biased. Two levels of current limit protection enhance the robustness of the power supply and requires no current sense resistor in the power path. The primary level of protection is the low side current limit and is achieved by sensing the voltage V_{DS} across the low side MOSFET. The second level of protection is the high side current limit, which protects power components from extremely high currents, caused by switch node short-circuit to ground.

Specifics Of The Board

The input voltage to the power components (V_{IN}) and the input voltage on the control section (V_{CC}) must be in the range of 3.0V to 5.5V. The 300 kHz demo board design regulates to an output voltage of 1.2V and up to 13A. The 1 MHz demo board design regulates to an output voltage of 1.5V and up to 9A. For additional design modifications refer to the Design Consideration section of the LM3743 data sheet. The PCB is designed on four layers, the top and bottom layers are 2oz. copper and the two inner layers are 1oz. copper. The board measures 2.4 in. x 1.36 in. (6.1 cm x 3.44 cm) and is 62mil (.062") thick on a FR4 laminate.

Additional Footprints

When the tracking feature of the LM3743 is used, remove the soft-start capacitor C4 and use a resistor divider on designators R7 and C4. The ground and Track post have been provided for your connecting convenience.

MOSFET Footprints

The LM3743 demo board accommodates footprints for single N-MOSFETs with standard SO-8 packages and with

exposed drain pads. The MOSFET footprint has the pinout as shown in *Figure 1*. Some examples of MOSFET packages with exposed drain pads are also illustrated.

Notes

National does not assume any responsibility for use of any circuitry described, no circuit patent licenses are implied and National reserves the right at any time without notice to change said circuitry and specifications.

For the most current product information visit us at www.national.com.

LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

BANNED SUBSTANCE COMPLIANCE

National Semiconductor follows the provisions of the Product Stewardship Guide for Customers (CSP-9-111C2) and Banned Substances and Materials of Interest Specification (CSP-9-111S2) for regulatory environmental compliance. Details may be found at: www.national.com/quality/green.

Lead free products are RoHS compliant.
