

LM4947 Boomer[®] Audio Power Amplifier Series Mono Class D and Stereo Audio Sub-System with OCL Headphone Amplifier and National 3D

General Description

The LM4947 is an audio subsystem capable of efficiently delivering 500mW (Class D operation) of continuous average power into a mono 8 Ω bridged-tied load (BTL) with 1% THD +N, 37mW (Class AB operation) power channel of continuous average power into stereo 32 Ω single-ended (SE) loads with 1% THD+N, or an output capacitor-less (OCL) configuration with identical specification as the SE configuration, from a 3.3V power supply.

The LM4947 has six input channels: one pair for a two-channel stereo signal, the second pair for a secondary two-channel stereo input, and the third pair for a differential single-channel mono input. Additionally, the two sets of stereo inputs may be configured as a single stereo differential input (differential left and differential right). The LM4947 features a 32-step digital volume control and eight distinct output modes. The digital volume control, 3D enhancement, and output modes are programmed through a two-wire I²C compatible interface that allows flexibility in routing and mixing audio channels.

The RF suppression circuitry in the LM4947 makes it well-suited for GSM mobile phones and other portable applications in which strong RF signals generated by an antenna (and long output traces) may couple audibly into the amplifier.

The LM4947 is designed for cellular phones, PDAs, and other portable handheld applications. It delivers high quality output power from a surface-mount package and requires only eight external components in the OCL mode (two additional components in SE mode).

Key Specifications

| | |
|--|-------------|
| ■ THD+N at 1kHz, 500mW into 8 Ω BTL (3.3V) | 1.0% (typ) |
| ■ THD+N at 1kHz, 37mW into 32 Ω SE (3.3V) | 1.0% (typ) |
| ■ Single Supply Operation (V_{DD}) | 2.7 to 5.5V |
| ■ I ² C Single Supply Operation | 2.2 to 5.5V |

Features

- I²C Control Interface
- I²C programmable National 3D Audio
- I²C controlled 32 step digital volume control (-59.5dB to +18dB)
- Three independent volume channels (Left, Right, Mono)
- Eight distinct output modes
- Small, 25-bump micro SMD packaging
- "Click and Pop" suppression circuitry
- Thermal shutdown protection
- Low shutdown current (0.1 μ A, typ)
- RF suppression
- Differential mono and stereo inputs
- Stereo input mux

Applications

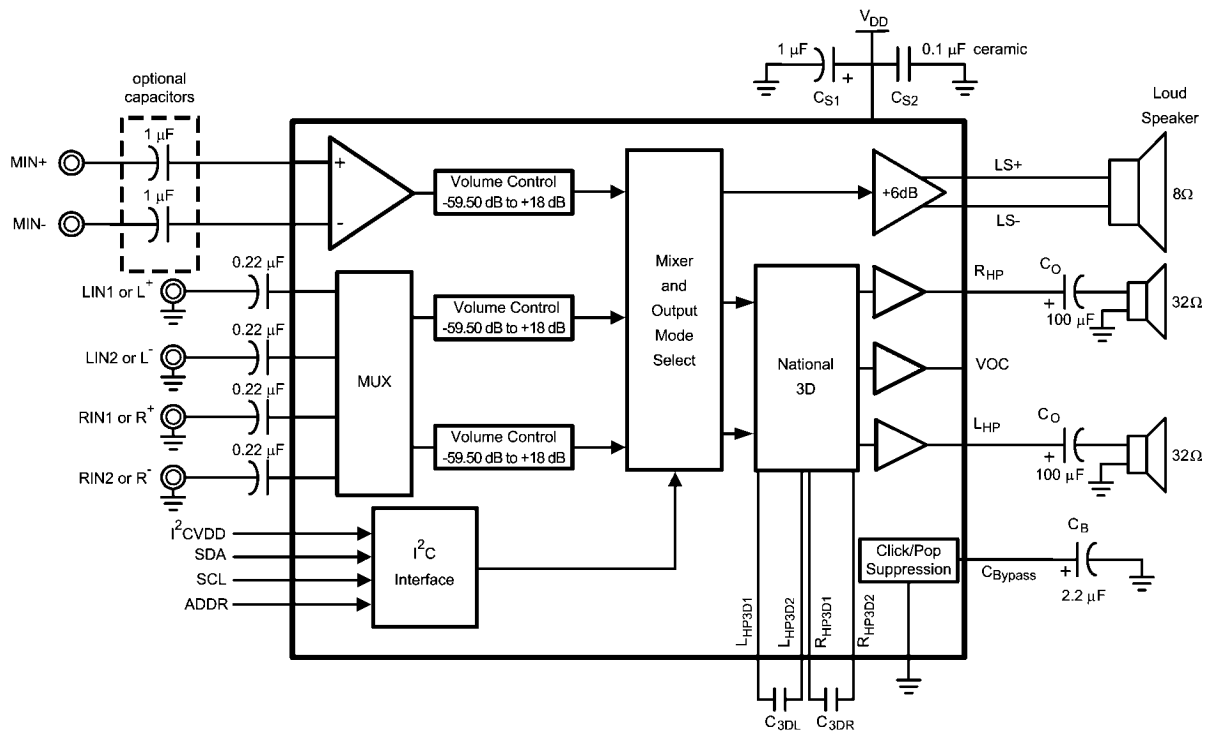

- Mobile Phones
- PDAs

Pin Descriptions

| Bump | Name | Description |
|------|--------------|---|
| A1 | R_{IN2} | Right Input Channel 2 or Right Differential Input - |
| A2 | L_{IN1} | Left Input Channel 1 or Left Differential Input + |
| A3 | MIN+ | Mono Channel Non-inverting Input |
| A4 | RHP_{3D1} | Right Headphone 3D Input 1 |
| A5 | RHP_{3D2} | Right Headphone 3D Input 2 |
| B1 | R_{IN1} | Right Input Channel 1 or Right Differential Input + |
| B2 | L_{IN2} | Left Input Channel 2 or Left Differential Input - |
| B3 | MIN- | Mono Channel Inverting Input |
| B4 | L_{HP3D1} | Left Headphone 3D Input 2 |
| B5 | L_{HP3D2} | Left Headphone 3D Input 1 |
| C1 | ADDR | Address Identification |
| C2 | SDA | Serial Data Input |
| C3 | SCL | Serial Clock Input |
| C4 | C_{BYPASS} | Half-Supply Bypass Capacitor |
| C5 | VOC | Headphone return bias output |
| D1 | AV_{DD} | Analog Power Supply |
| D2 | LSV_{DD} | Loudspeaker Power Supply |
| D3 | $I2CV_{DD}$ | I2C Interface Power Supply |
| D4 | AV_{DD} | Analog Power Supply |
| D5 | R_{HP} | Right Headphone Output |
| E1 | LS- | Loudspeaker Output Negative |
| E2 | GND | Ground |
| E3 | LS+ | Loudspeaker Output Positive |
| E4 | GND | Ground |
| E5 | L_{HP} | Left Headphone Output |

Absolute Maximum Ratings (Note 2)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

| | |
|--------------------------------|------------------------|
| Supply Voltage | 6.0V |
| Storage Temperature | -65°C to +150°C |
| Input Voltage | -0.3 to $V_{DD} + 0.3$ |
| ESD Susceptibility (Note 3) | 2.0kV |
| ESD Machine model (Note 6) | 200V |
| Junction Temperature (T_J) | 150°C |
| Solder Information | |

| | |
|--------------------------------|--------|
| Vapor Phase (60 sec.) | 215°C |
| Infrared (15 sec.) | 220°C |
| Thermal Resistance | |
| θ_{JA} (typ) - TLA25CBA | 65°C/W |

Operating Ratings

| | |
|--|------------------------------|
| Temperature Range | -40°C to 85°C |
| Supply Voltage (V_{DD}) | $2.7V \leq V_{DD} \leq 5.5V$ |
| Supply Voltage (I^2C) | $2.2V \leq V_{DD} \leq 5.5V$ |
| Supply Voltage (Loudspeaker V_{DD}) | $2.7V \leq V_{DD} \leq 5.5V$ |

Electrical Characteristics 3.3V (Notes 2, 7)

The following specifications apply for $V_{DD} = 3.3V$, $T_A = 25^\circ C$, and all gains are set for 0dB unless otherwise specified.

| Symbol | Parameter | Conditions | LM4947 | | Units (Limits) |

I²C (Notes 2, 7)

The following specifications apply for $V_{DD} = 5V$ and $3.3V$, $T_A = 25^\circ C$ unless otherwise specified.

| Symbol | Parameter | Conditions | LM4947 | | Units (Limits) |
|----------|------------------------|------------|---------------------|-------------------------------|-------------------|
| | | | Typical (Note 4) | Limits (Note 5) | |
| t_1 | Clock Period | | | 2.5 | μs (max) |
| t_2 | Clock Setup Time | | | 100 | ns (min) |
| t_3 | Data Hold Time | | | 100 | ns (min) |
| t_4 | Start Condition Time | | | 100 | ns (min) |
| t_5 | Stop Condition Time | | | 100 | ns (min) |
| V_{IH} | SPI Input Voltage High | | | $0.7 \times I^2C$ V_{DD} | V (min) |
| V_{IL} | SPI Input Voltage Low | | | $0.3 \times I^2C$ V_{DD} | V (max) |

I²C Protocol Information

The I²C address for the LM4947 is determined using the ID_ENB pin. The LM4947's two possible I²C chip addresses are of the form 111110X₁0 (binary), where X₁ = 0, if ID_ADDR

is logic LOW; and X₁ = 1, if ID_ENB is logic HIGH. If the I²C interface is used to address a number of chips in a system, the LM4947's chip address can be changed to avoid any possible address conflicts.

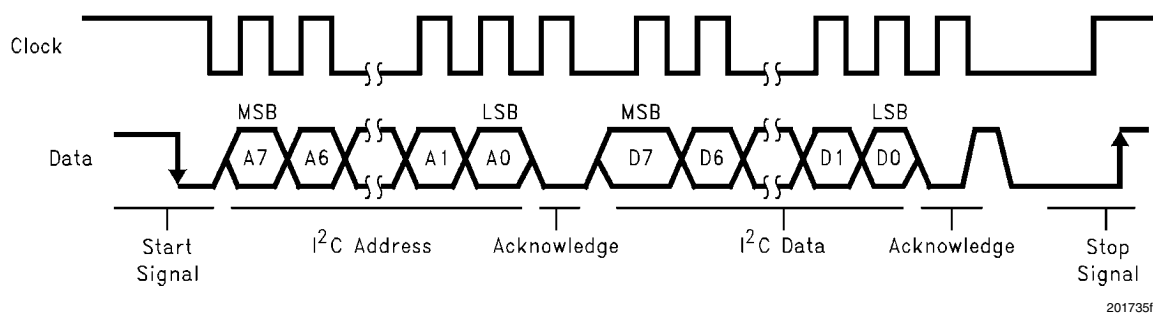

FIGURE 3. I²C Bus Format

FIGURE 4. I²C Timing Diagram

Note 1: See AN-450 "Surface Mounting and their effects on Product Reliability" for other methods of soldering surface mount devices.

Note 2: Operating Ratings indicate conditions for which the device is functional, but do not guarantee specific performance limits. For guaranteed specifications and test conditions, see the Electrical Characteristics. The guaranteed specifications apply only for the test conditions listed. Some performance characteristics may degrade when the device is not operated under the listed test conditions.

Note 3: Human body model, 100pF discharged through a 1.5k Ω resistor.

Note 4: Typical specifications are specified at +25°C and represent the most likely parametric norm.

Note 5: Tested limits are guaranteed to National's AOQL (Average Outgoing Quality Level).

Note 6: Machine Model ESD test is covered by specification EIAJ IC-121-1981. A 200pF cap is charged to the specified voltage, then discharged directly into the IC with no external series resistor (resistance of discharge path must be under 50 Ω).

Note 7: All voltages are measured with respect to the ground pin, unless otherwise specified.

Note 8: The given θ_{JA} for an LM4947TL mounted on a demonstration board with a 9in² area of 1oz printed circuit board copper ground plane.

Note 9: Datasheet min/max specifications are guaranteed by design, test, or statistical analysis.

Application Information

I²C PIN DESCRIPTION

SDA: This is the serial data input pin.

SCL: This is the clock input pin.

ID_ENB: This is the address select input pin.

I²C COMPATIBLE INTERFACE

The LM4947 uses a serial bus which conforms to the I²C protocol to control the chip's functions with two wires: clock (SCL) and data (SDA). The clock line is uni-directional. The data line is bi-directional (open-collector). The maximum clock frequency specified by the I²C standard is 400kHz. In this discussion, the master is the controlling microcontroller and the slave is the LM4947.

The I²C address for the LM4947 is determined using the ID_ENB pin. The LM4947's two possible I²C chip addresses are of the form 11110X₁0 (binary), where X₁ = 0, if ID_ADDR is logic LOW; and X₁ = 1, if ID_ENB is logic HIGH. If the I²C interface is used to address a number of chips in a system, the LM4947's chip address can be changed to avoid any possible address conflicts.

The bus format for the I²C interface is shown in Figure 3. The bus format diagram is broken up into six major sections:

The "start" signal is generated by lowering the data signal while the clock signal is HIGH. The start signal will alert all devices attached to the I²C bus to check the incoming address against their own address.

The 8-bit chip address is sent next, most significant bit first. The data is latched in on the rising edge of the clock. Each address bit must be stable while the clock level is HIGH.

After the last bit of the address bit is sent, the master releases the data line HIGH (through a pull-up resistor). Then the master sends an acknowledge clock pulse. If the LM4947 has received the address correctly, then it holds the data line LOW during the clock pulse. If the data line is not held LOW during the acknowledge clock pulse, then the master should abort the rest of the data transfer to the LM4947.

The 8 bits of data are sent next, most significant bit first. Each data bit should be valid while the clock level is stable HIGH.

After the data byte is sent, the master must check for another acknowledge to see if the LM4947 received the data.

The "stop" signal ends the transfer. To signal "stop", the data signal goes HIGH while the clock signal is HIGH. The data line should be held HIGH when not in use.

I²C INTERFACE POWER SUPPLY PIN (I²CV_{DD})

The LM4947's I²C interface is powered up through the I²CV_{DD} pin. The LM4947's I²C interface operates at a voltage level set by the I²CV_{DD} pin which can be set independent to that of the main power supply pin V_{DD}. This is ideal whenever logic levels for the I²C interface are dictated by a microcontroller or microprocessor that is operating at a lower supply voltage than the main battery of a portable system.

SD = Shutdown

MUTE = Mute Mode

G_M = Mono volume control gain

G_R = Right stereo volume control gain

G_L = Left stereo volume control gain

NATIONAL 3D ENHANCEMENT

The LM4947 features a stereo headphone, 3D audio enhancement effect that widens the perceived soundstage from a stereo audio signal. The 3D audio enhancement creates a perceived spatial effect optimized for stereo headphone listening. The LM4947 can be programmed for a “narrow” or “wide” soundstage perception. The narrow soundstage has a more focused approaching sound direction, while the wide soundstage has a spatial, theater-like effect. Within each of these two modes, four discrete levels of 3D effect that can be programmed: low, medium, high, and maximum (Table 2), each level with an ever increasing aural effect, respectively. The difference between each level is 3dB.

The external capacitors, shown in Figure 6, are required to enable the 3D effect. The value of the capacitors set the cutoff frequency of the 3D effect, as shown by Equations 1 and 2. Note that the internal 20k Ω resistor is nominal ($\pm 25\%$).

20173509

FIGURE 5. External 3D Effect Capacitors

$$f_{3DL(-3dB)} = 1 / 2\pi * 20k\Omega * C_{3DL} \quad (1)$$

$$f_{3DR(-3dB)} = 1 / 2\pi * 20k\Omega * C_{3DR} \quad (2)$$

Optional resistors R_{3DL} and R_{3DR} can also be added (Figure 7) to affect the -3dB frequency and 3D magnitude.

20173508

FIGURE 6. External RC Network with Optional R_{3DL} and R_{3DR} Resistors

$$f_{3DL(-3dB)} = 1 / 2\pi * (20k\Omega + R_{3DL}) * C_{3DL} \quad (3)$$

$$f_{3DR(-3dB)} = 1 / 2\pi * 20k\Omega + R_{3DR}) * C_{3DR} \quad (4)$$

ΔAV (change in AC gain) = $1 / (1 + M)$, where M represents some ratio of the nominal internal resistor, 20k Ω (see example below).

$$C_{\text{Equivalent}} (\text{new}) = C_{3D} / (1 + M) \quad (6)$$

$$f_{3dB} (3D) = 1 / (2\pi (1 + M)(20k\Omega * C_{3D})) \quad (5)$$

PCB LAYOUT AND SUPPLY REGULATION CONSIDERATIONS FOR DRIVING 8 Ω LOAD

Power dissipated by a load is a function of the voltage swing across the load and the load's impedance. As load impedance decreases, load dissipation becomes increasingly dependent on the interconnect (PCB trace and wire) resistance between the amplifier output pins and the load's connections. Residual trace resistance causes a voltage drop, which results in power dissipated in the trace and not in the load as desired. For example, 0.1 Ω trace resistance reduces the output power dissipated by an 8 Ω load from 158.3mW to 156.4mW. The problem of decreased load dissipation is exacerbated as load impedance decreases. Therefore, to maintain the highest load dissipation and widest output voltage swing, PCB traces that connect the output pins to a load must be as wide as possible.

Poor power supply regulation adversely affects maximum output power. A poorly regulated supply's output voltage decreases with increasing load current. Reduced supply voltage causes decreased headroom, output signal clipping, and reduced output power. Even with tightly regulated supplies, trace resistance creates the same effects as poor supply regulation. Therefore, making the power supply traces as wide as possible helps maintain full output voltage swing.

POWER DISSIPATION AND EFFICIENCY

In general terms, efficiency is considered to be the ratio of useful work output divided by the total energy required to produce it with the difference being the power dissipated, typically, in the IC. The key here is "useful" work. For audio systems, the energy delivered in the audible bands is considered useful including the distortion products of the input signal. Sub-sonic (DC) and super-sonic components (>22kHz) are not useful. The difference between the power flowing from the power supply and the audio band power being transduced is dissipated in the LM4947 and in the transducer load. The amount of power dissipation in the LM4947 is very low. This is because the ON resistance of the switches used to form the output waveforms is typically less than 0.25 Ω . This leaves only the transducer load as a potential "sink" for the small excess of input power over audio band output power. The LM4947 dissipates only a fraction of the excess power requiring no additional PCB area or copper plane to act as a heat sink.

The LM4947 also has a pair of single-ended amplifiers driving stereo headphones, R_{HP} and L_{HP}. The maximum internal

power dissipation for R_{HP} and L_{HP} is given by equation (9) and (10). From Equations (9) and (10), assuming a 5V power supply and a 32 Ω load, the maximum power dissipation for L_{HP} and R_{HP} is 40mW, or 80mW total.

$$P_{\text{DMAX-LHP}} = (V_{DD})^2 / (2\pi^2 R_L): \text{Single-ended Mode} \quad (7)$$

$$P_{\text{DMAX-RHP}} = (V_{DD})^2 / (2\pi^2 R_L): \text{Single-ended Mode} \quad (8)$$

The maximum internal power dissipation of the LM4947 occurs when all 3 amplifiers pairs are simultaneously on; and is given by Equation (11).

$$P_{\text{DMAX-TOTAL}} = P_{\text{DMAX-SPKROUT}} + P_{\text{DMAX-LHP}} + P_{\text{DMAX-RHP}} \quad (9)$$

The maximum power dissipation point given by Equation (11) must not exceed the power dissipation given by Equation (12):

$$P_{\text{DMAX}} = (T_{J\text{MAX}} - T_A) / \theta_{JA} \quad (10)$$

The LM4947's $T_{J\text{MAX}} = 150^\circ\text{C}$. In the ITL package, the LM4947's θ_{JA} is 65 $^\circ\text{C/W}$. At any given ambient temperature T_A , use Equation (12) to find the maximum internal power dissipation supported by the IC packaging. Rearranging Equation (12) and substituting $P_{\text{DMAX-TOTAL}}$ for P_{DMAX} results in Equation (13). This equation gives the maximum ambient temperature that still allows maximum stereo power dissipation without violating the LM4947's maximum junction temperature.

$$T_A = T_{J\text{MAX}} - P_{\text{DMAX-TOTAL}} \theta_{JA} \quad (11)$$

For a typical application with a 5V power supply and an 8 Ω load, the maximum ambient temperature that allows maximum stereo power dissipation without exceeding the maximum junction temperature is approximately 104 $^\circ\text{C}$ for the ITL package.

$$T_{J\text{MAX}} = P_{\text{DMAX-TOTAL}} \theta_{JA} + T_A \quad (12)$$

Equation (14) gives the maximum junction temperature $T_{J\text{MAX}}$. If the result violates the LM4947's 150 $^\circ\text{C}$, reduce the maximum junction temperature by reducing the power supply

voltage or increasing the load resistance. Further allowance should be made for increased ambient temperatures.

The above examples assume that a device is a surface mount part operating around the maximum power dissipation point. Since internal power dissipation is a function of output power, higher ambient temperatures are allowed as output power or duty cycle decreases. If the result of Equation (11) is greater than that of Equation (12), then decrease the supply voltage, increase the load impedance, or reduce the ambient temperature. If these measures are insufficient, a heat sink can be added to reduce θ_{JA} . The heat sink can be created using additional copper area around the package, with connections to the ground pin(s), supply pin and amplifier output pins. External, solder attached SMT heatsinks such as the Thermalloy 7106D can also improve power dissipation. When adding a heat sink, the θ_{JA} is the sum of θ_{JC} , θ_{CS} , and θ_{SA} . (θ_{JC} is the junction-to-case thermal impedance, θ_{CS} is the case-to-sink thermal impedance, and θ_{SA} is the sink-to-ambient thermal impedance). Refer to the Typical Performance Characteristics curves for power dissipation information at lower output power levels.

POWER SUPPLY BYPASSING

As with any power amplifier, proper supply bypassing is critical for low noise performance and high power supply rejection. Applications that employ a 5V regulator typically use a 1 μ F in parallel with a 0.1 μ F filter capacitors to stabilize the regulator's output, reduce noise on the supply line, and improve the supply's transient response. However, their presence does not eliminate the need for a local 1.1 μ F tantalum bypass capacitance connected between the LM4947's supply pins and ground. Keep the length of leads and traces that connect capacitors between the LM4947's power supply pin and ground as short as possible. Connecting a 2.2 μ F capacitor, C_B , between the BYPASS pin and ground improves the internal bias voltage's stability and improves the amplifier's PSRR. The PSRR improvements increase as the bypass pin capacitor value increases. Too large, however, increases turn-on time and can compromise the amplifier's click and pop performance. The selection of bypass capacitor values, especially C_B , depends on desired PSRR requirements, click and pop performance (as explained in the section, Proper Selection of External Components), system cost, and size constraints.

SELECTING EXTERNAL COMPONENTS

Input Capacitor Value Selection

Amplifying the lowest audio frequencies requires high value input coupling capacitor (C_i in Figures 1 & 2). A high value capacitor can be expensive and may compromise space efficiency in portable designs. In many cases, however, the speakers used in portable systems, whether internal or external, have little ability to reproduce signals below 150Hz. Applications using speakers with this limited frequency response reap little improvement by using large input capacitor. The internal input resistor (R_i), nominal 20k Ω , and the input capacitor (C_i) produce a high pass filter cutoff frequency that is found using Equation (15).

$$f_c = 1 / (2\pi R_i C_i) \quad (13)$$

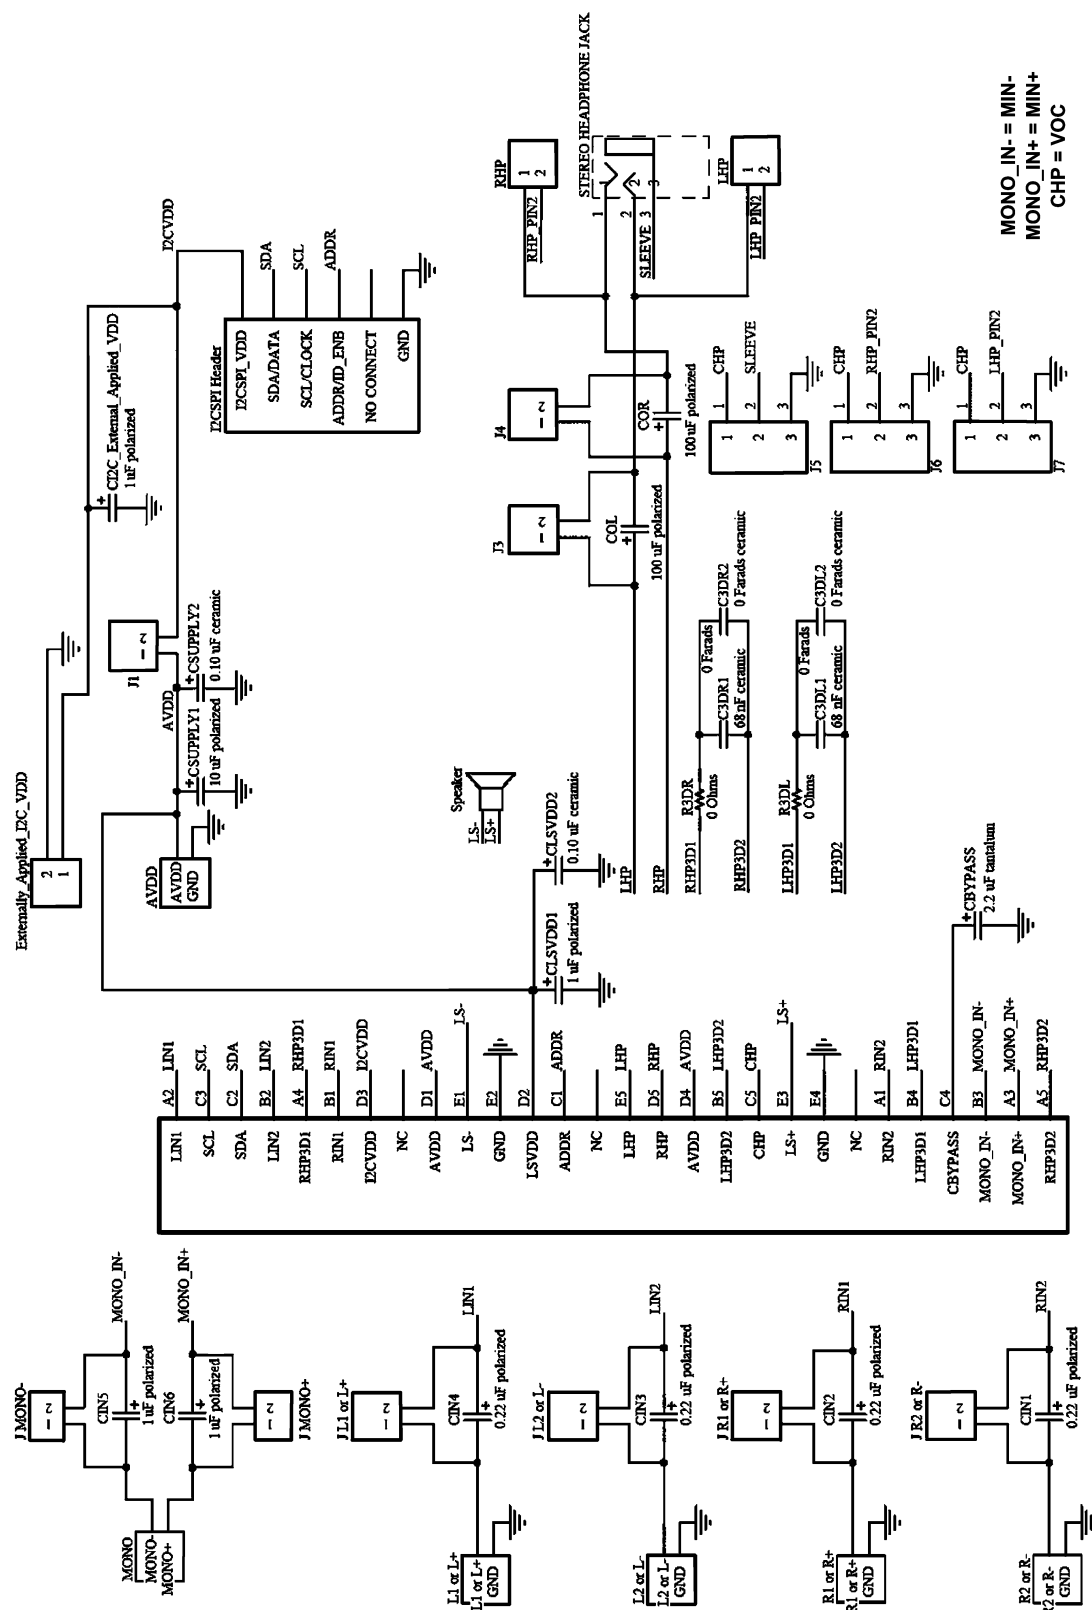

As an example when using a speaker with a low frequency limit of 150Hz, C_i , using Equation (15) is 0.053 μ F. The 0.22 μ F C_i shown in *Figure 1* allows the LM4947 to drive high effi-

ciency, full range speaker whose response extends below 40Hz.

Bypass Capacitor Value Selection

Besides minimizing the input capacitor size, careful consideration should be paid to value of C_B , the capacitor connected to the BYPASS bump. Since C_B determines how fast the LM4947 settles to quiescent operation, its value is critical when minimizing turn-on pops. The slower the LM4947's outputs ramp to their quiescent DC voltage (nominally $V_{DD}/2$), the smaller the turn-on pop. Choosing C_B equal to 1.0 μ F along with a small value of C_i (in the range of 0.1 μ F to 0.39 μ F), produces a click-less and pop-less shutdown function. As discussed above, choosing C_i no larger than necessary for the desired bandwidth helps minimize clicks and pops. C_B 's value should be in the range of 5 times to 7 times the value of C_i . This ensures that output transients are eliminated when power is first applied or the LM4947 resumes operation after shutdown.

EXCEPT WHERE MANDATED BY GOVERNMENT REQUIREMENTS, TESTING OF ALL PARAMETERS OF EACH PRODUCT IS NOT NECESSARILY PERFORMED. NATIONAL ASSUMES NO LIABILITY FOR APPLICATIONS ASSISTANCE OR BUYER PRODUCT DESIGN. BUYERS ARE RESPONSIBLE FOR THEIR PRODUCTS AND APPLICATIONS USING NATIONAL COMPONENTS. PRIOR TO USING OR DISTRIBUTING ANY PRODUCTS THAT INCLUDE NATIONAL COMPONENTS, BUYERS SHOULD PROVIDE ADEQUATE DESIGN, TESTING AND OPERATING SAFEGUARDS.

EXCEPT AS PROVIDED IN NATIONAL'S TERMS AND CONDITIONS OF SALE FOR SUCH PRODUCTS, NATIONAL ASSUMES NO LIABILITY WHATSOEVER, AND NATIONAL DISCLAIMS ANY EXPRESS OR IMPLIED WARRANTY RELATING TO THE SALE AND/OR USE OF NATIONAL PRODUCTS INCLUDING LIABILITY OR WARRANTIES RELATING TO FITNESS FOR A PARTICULAR PURPOSE, MERCHANTABILITY, OR INFRINGEMENT OF ANY PATENT, COPYRIGHT OR OTHER INTELLECTUAL PROPERTY RIGHT.

LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS PRIOR WRITTEN APPROVAL OF THE CHIEF EXECUTIVE OFFICER AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

Life support devices or systems are devices which (a) are intended for surgical implant into the body, or (b) support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in a significant injury to the user. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system or to affect its safety or effectiveness.
