

## LMH0344

### 3 Gbps HD/SD SDI Adaptive Cable Equalizer

#### General Description

The LMH0344 3 Gbps HD/SD SDI Adaptive Cable Equalizer is designed to equalize data transmitted over cable (or any media with similar dispersive loss characteristics). The equalizer operates over a wide range of data rates from 143 Mbps to 2.97 Gbps and supports SMPTE 424M, SMPTE 292M, SMPTE 344M, and SMPTE 259M.

The LMH0344 implements DC restoration to correctly handle pathological data conditions. The equalizer may be driven in either a single ended or differential configuration.

Additional features include separate carrier detect and output mute pins which may be tied together to mute the output when no signal is present. A programmable mute reference is provided to mute the output at a selectable level of signal degradation.

The device is available in two space-saving packages: a 4 X 4 mm 16-pin LLP and even more space-efficient 3 x 3 mm 25-ball MICRO-ARRAY package.

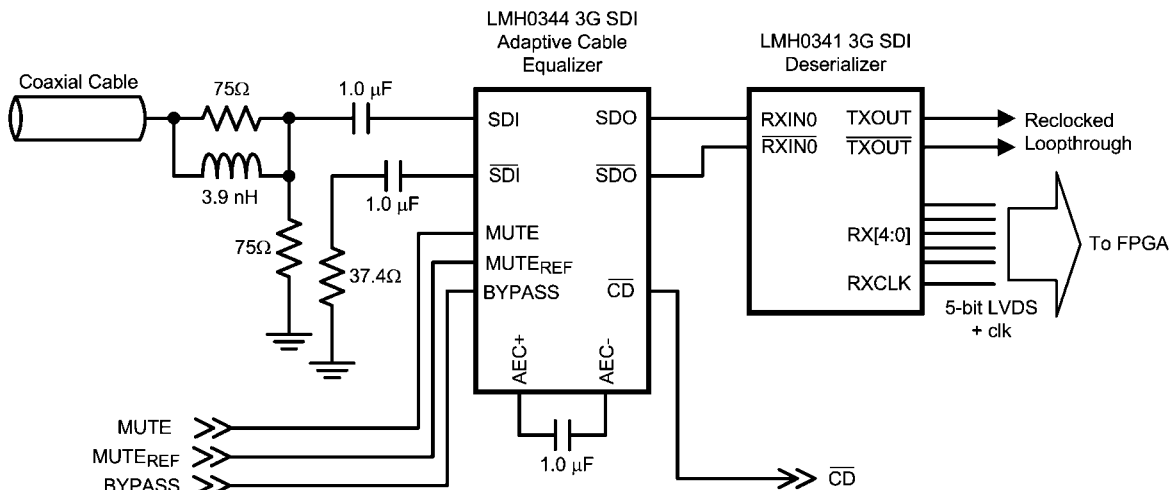

#### Features

- SMPTE 424M, SMPTE 292M, SMPTE 344M, and SMPTE 259M compliant
- Supports DVB-ASI at 270 Mbps
- High data rates: 143 Mbps to 2.97 Gbps
- Equalizes up to 120 meters of Belden 1694A at 2.97 Gbps, up to 140 meters of Belden 1694A at 1.485 Gbps, or up to 400 meters of Belden 1694A at 270 Mbps
- Equalizes 0-120m of Belden 1694A at 2.97 Gbps with 0.3 UI maximum output jitter
- Manual bypass and output mute with a programmable threshold
- Single-ended or differential input
- 50Ω differential outputs (internal 50Ω pullups)
- Single 3.3V supply operation
- 280 mW typical power consumption
- 16-pin LLP or 25-ball MICRO-ARRAY package
- Industrial temperature range: -40°C to +85°C
- HBM ESD Rating: 8 kV
- LLP version footprint compatible with the LMH0044 and LMH0074
- Replaces the Gennum GS2974A or GS2974B

#### Applications

- SMPTE 424M, SMPTE 292M, SMPTE 344M, and SMPTE 259M serial digital interfaces
- Serial digital data equalization and reception
- Data recovery equalization

**Note 1:** "Absolute Maximum Ratings" are those parameter values beyond which the life and operation of the device cannot be guaranteed. The stating herein of these maximums shall not be construed to imply that the device can or should be operated at or beyond these values. The table of "Electrical Characteristics" specifies acceptable device operating conditions.

**Note 2:** Current flow into device pins is defined as positive. Current flow out of device pins is defined as negative. All voltages are stated referenced to V<sub>EE</sub> = 0 Volts.

**Note 3:** Typical values are stated for V<sub>CC</sub> = +3.3V and T<sub>A</sub> = +25°C.

**Note 4:** Specification is guaranteed by characterization.

**Note 5:** This specification is for 0m cable only.

**Note 6:** Based on characterization data over the full range of recommended operating conditions of the device. Jitter is measured in accordance with SMPTE RP 184, SMPTE RP 192, and the applicable serial data transmission standard: SMPTE 424M, SMPTE 292M, or SMPTE 259M.

**Note 7:** Measured with Pseudo Matrix Pathological test signal.

**Note 8:** Input return loss is dependent on board design. The LMH0344 exceeds this specification on the SD344 evaluation board with a return loss network consisting of an 8.2 nH inductor in parallel with a 0.5 pF capacitor in parallel with the 75Ω series resistor on the input.

## Pin Descriptions

LLP Pin	MICRO-ARRAY Ball	Name	Description
2	C1	SDI	Serial data true input.
3	D1	$\overline{\text{SDI}}$	Serial data complement input.
5	E2	AEC+	AEC loop filter external capacitor (1 $\mu$ F) positive connection.
6	E3	AEC-	AEC loop filter external capacitor (1 $\mu$ F) negative connection.
7	D3	BYPASS	Bypasses equalization and DC restoration when high. No equalization occurs in this mode.
8	E4	MUTE <sub>REF</sub>	Mute reference. Sets the threshold for $\overline{\text{CD}}$ and (with $\overline{\text{CD}}$ tied to MUTE) determines the maximum cable to be equalized before muting. MUTE <sub>REF</sub> may be either unconnected or connected to ground for maximum equalization.
10	D5	$\overline{\text{SDO}}$	Serial data complement output.
11	C5	SDO	Serial data true output.
14	B3	MUTE	Output mute. To disable the mute function and enable the output, MUTE must be tied to GND or a low level signal. To force the outputs to a muted state, tie to V <sub>CC</sub> . $\overline{\text{CD}}$ may be tied to this pin to inhibit the output when no input signal is present. MUTE has no function in BYPASS mode.
15	A2	$\overline{\text{CD}}$	Carrier detect. $\overline{\text{CD}}$ is high when no signal is present. $\overline{\text{CD}}$ has no function in BYPASS mode.
13, 16	A1, A3, A4, B2	V <sub>CC</sub>	Positive power supply (+3.3V).
DAP, 1, 4, 9, 12	B1, B4, D2, E5	V <sub>EE</sub>	Negative power supply (ground).
—	A5, B5, C2, C3, C4, D4, E1	NC	No connect.

## Device Operation

### BLOCK DESCRIPTION

The **Equalizer Filter** block is a multi-stage adaptive filter. If Bypass is high, the equalizer filter is disabled.

The **DC Restoration / Level Control** block receives the differential signals from the equalizer filter block. This block incorporates a self-biasing DC restoration circuit to fully DC restore the signals. If Bypass is high, this function is disabled.

The signals before and after the DC Restoration / Level Control block are used to generate the **Automatic Equalization Control (AEC)** signal. This control signal sets the gain and bandwidth of the equalizer filter. The loop response in the AEC block is controlled by an external  $1\mu F$  capacitor placed across the **AEC+** and **AEC-** pins.

The **Carrier Detect / Mute** block generates the carrier detect signal and controls the mute function of the output. This block utilizes the  $\overline{CD}$  and **MUTE** signals along with **Mute Reference (MUTE<sub>REF</sub>)**.

The **Output Driver** produces  $SDO$  and  $\overline{SDO}$ .

### MUTE REFERENCE (MUTE<sub>REF</sub>)

The mute reference sets the threshold for  $\overline{CD}$  and (with  $\overline{CD}$  tied to **MUTE**) determines the amount of cable to equalize before automatically muting the outputs. This is set by applying a voltage inversely proportional to the length of cable to equalize. The applied voltage must be greater than the **MUTE<sub>REF</sub>** floating voltage (typically 1.3V) in order to change the  $\overline{CD}$  threshold. As the applied **MUTE<sub>REF</sub>** voltage is increased, the amount of cable that can be equalized before

carrier detect is de-asserted and the outputs are muted is decreased. **MUTE<sub>REF</sub>** may be left unconnected or connected to ground for maximum equalization before muting.

### CARRIER DETECT ( $\overline{CD}$ ) AND MUTE

Carrier detect  $\overline{CD}$  indicates if a valid signal is present at the LMH0344 input. If **MUTE<sub>REF</sub>** is used, the carrier detect threshold will be altered accordingly.  $\overline{CD}$  provides a high voltage when no signal is present at the LMH0344 input.  $\overline{CD}$  is low when a valid input signal is detected.

**MUTE** can be used to manually mute or enable  $SDO$  and  $\overline{SDO}$ . Applying a high input to **MUTE** will mute the LMH0344 outputs by forcing the output to a logic zero. Applying a low input will force the outputs to be active.

$\overline{CD}$  and **MUTE** may be tied together to automatically mute the output when no input signal is present.

### INPUT INTERFACING

The LMH0344 accepts either differential or single-ended input. The input must be AC coupled. Transformer coupling is not supported.

The LMH0344 correctly handles equalizer pathological signals for standard definition and high definition serial digital video, as described in SMPTE RP 178 and RP 198, respectively.

### OUTPUT INTERFACING

The  $SDO$  and  $\overline{SDO}$  outputs are internally loaded with  $50\Omega$ . They produce a  $750\text{ mV}_{P-P}$  differential output, or a  $375\text{ mV}_{P-P}$  single-ended output.
