

**DESCRIPTION**

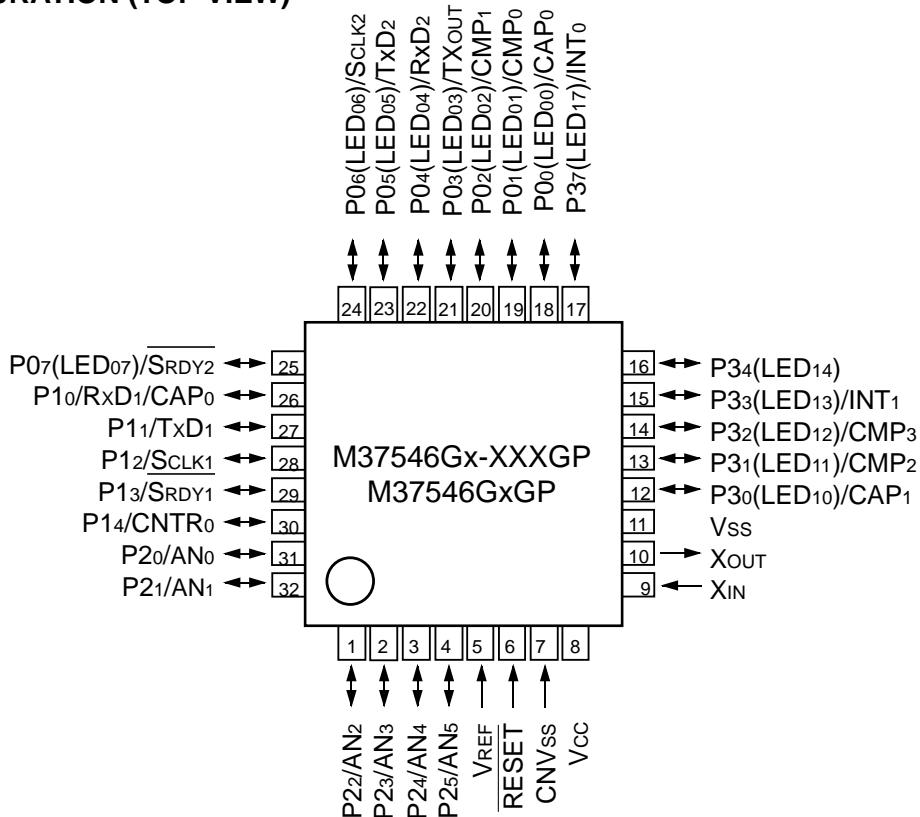

The 7546 Group is the QzROM version of 7542 Group.  
 The 7546 Group has the pin-compatibility with the 7542 Group. As new functions, the power-on reset, the low voltage detection circuit, and the function set ROM are added.

**FEATURES**

- Basic machine-language instructions ..... 71
- The minimum instruction execution time ..... 0.25  $\mu$ s  
 (at 8 MHz oscillation frequency, double-speed mode for the shortest instruction)
- Memory size
  - ROM ..... 8K, 16K bytes
  - RAM ..... 384, 512 bytes
- Programmable I/O ports ..... 25
- Interrupts ..... 18 sources, 16 vectors
- Timers ..... 8-bit  $\times$  2  
 ..... 16-bit  $\times$  2
- Output compare ..... 4-channel
- Input capture ..... 2-channel
- Serial interface ..... 8-bit  $\times$  2 (UART or Clock-synchronized)
- A/D converter ..... 10-bit  $\times$  6 channels
- Clock generating circuit ..... Built-in type  
 (low-power dissipation by an on-chip oscillator)  
 (connected to external ceramic resonator or quartz-crystal oscillator permitting RC oscillation)

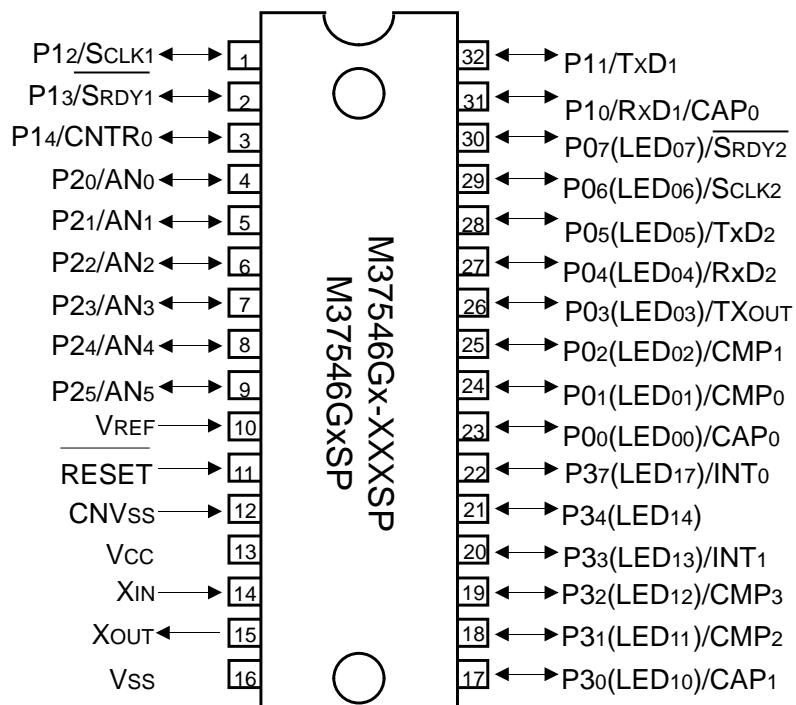

- Watchdog timer ..... 16-bit  $\times$  1
- Power-on reset circuit ..... Built-in type
- Low voltage detection circuit ..... Built-in type
- Power source voltage
  - XIN oscillation frequency at ceramic oscillation, in double-speed mode
  - At 8 MHz ..... 4.5 to 5.5 V
  - At 6.5 MHz ..... 4.0 to 5.5 V
  - At 2 MHz ..... 2.4 to 5.5 V
  - At 1 MHz ..... 2.2 to 5.5 V
  - XIN oscillation frequency at ceramic oscillation, in high-speed mode or middle-speed mode
  - At 8 MHz ..... 4.0 to 5.5 V
  - At 4 MHz ..... 2.4 to 5.5 V
  - At 2 MHz ..... 2.2 to 5.5 V
  - XIN oscillation frequency at RC oscillation in high-speed mode or middle-speed mode
  - At 4 MHz ..... 4.0 to 5.5 V
  - At 2 MHz ..... 2.4 to 5.5 V
  - At 1 MHz ..... 2.2 to 5.5 V
  - XIN oscillation frequency at on-chip oscillation ..... 1.8 to 5.5 V
- Power dissipation ..... 29.5 mW (Typ.)
- Operating temperature range ..... -20 to 85 °C

## PIN CONFIGURATION (TOP VIEW)

Package type: PLQP0032GB-A (32P6U-A)

Fig. 1 Pin configuration (Package type: PLQP0032GB-A)

Package type: PRDP0032BA-A (32P4B)

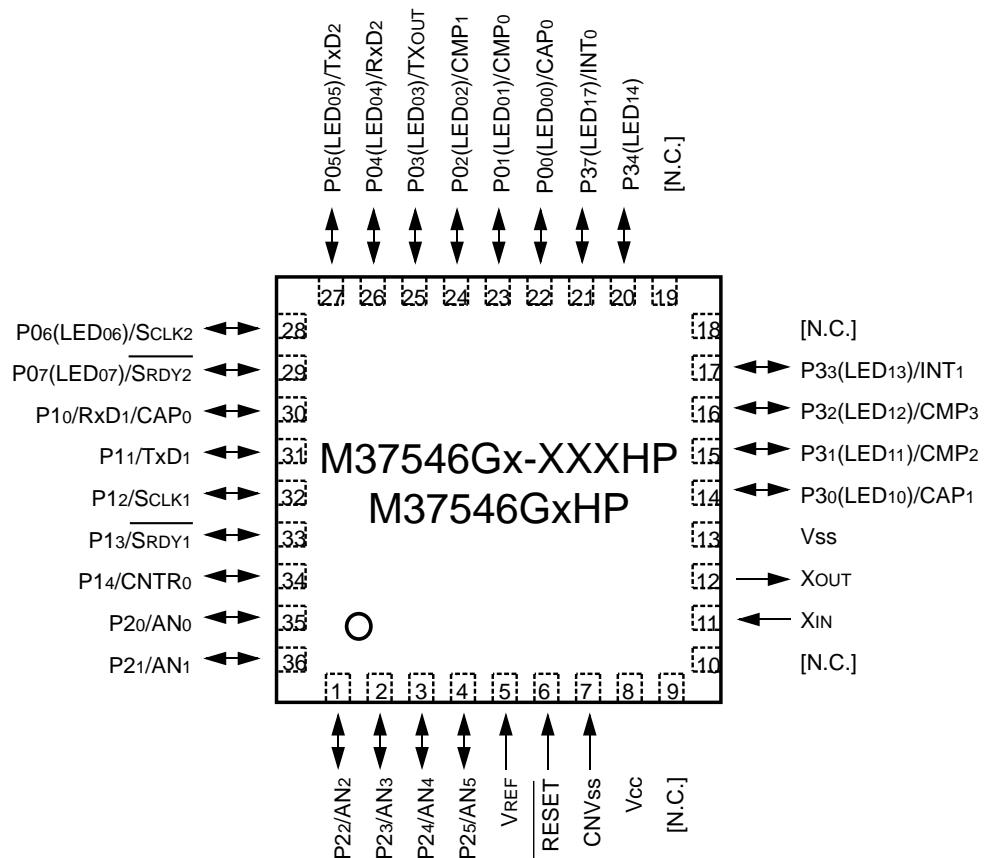

Fig. 3 Pin configuration (Package type: PWQN0036KA-A)

Table 1 Performance overview

Parameter		Function	
Number of basic instructions		71	
Instruction execution time		0.25 $\mu$ s (Minimum instruction, oscillation frequency 8 MHz: double-speed mode)	
Oscillation frequency		8 MHz (max.)	
Memory sizes	ROM	8 K to 16 K bytes	
	RAM	384 to 512 bytes	
I/O port	P0, P1, P2, P3	•8-bit X 1, 6-bit X 2, 5-bit X 1	
Interrupts		18 sources, 16 vectors	
Timer		•8-bit X 2, 16-bit X 2	
Output compare		4 channel	
Input capture		2 channel	
Serial interface		8-bit X 2 (UART or clock synchronous)	
A/D converter		10-bit X 6 channel	
Watchdog timer		16-bit X 1	
Clock generating circuit		Built-in (external ceramic resonator or quartz-crystal oscillator, RC oscillation available) (Low consumption current by on-chip oscillator available)	
Power source voltage (at ceramic resonance)	Double-speed mode	At 8MHz oscillation	
		4.5 to 5.5 V	
		At 6.5MHz oscillation	
		4.0 to 5.5 V	
	High-speed mode Middle-speed mode	At 2MHz oscillation	
		2.4 to 5.5 V	
		At 1MHz oscillation	
Power source voltage (at RC oscillation)	High-speed mode Middle-speed mode	At 8MHz oscillation	
		4.0 to 5.5 V	
		At 4MHz oscillation	
		At 2MHz oscillation	
		2.4 to 5.5 V	
		At 1MHz oscillation	
Power source voltage (at on-chip oscillation)		2.2 to 5.5 V	
Power dissipation		1.8 to 5.5 V	
Operating temperature range		29.5 mW (Typ.)	
Device structure		-20 to 85 °C	
Package		CMOS silicon gate	
		32-pin plastic molded SDIP/LQFP	
		36-pin plastic molded WQFN

## PIN DESCRIPTION

**Table 2 Pin description**

Pin	Name	Function	Function expect a port function
Vcc, Vss	Power source	Apply voltage of 1.8 to 5.5 V to Vcc, and 0 V to Vss.	
VREF	Analog reference voltage	•Reference voltage input pin for A/D converter.	
CNVss	CNVss	•Chip operating mode control pin, which is always connected to Vss.	
RESET	Reset input	•Reset input pin for active “L”	
XIN	Clock input	<ul style="list-style-type: none"> <li>•Input and output pins for main clock generating circuit.</li> <li>•Connect a ceramic resonator or quartz crystal oscillator between the XIN and XOUT pins.</li> </ul>	
XOUT	Clock output	<ul style="list-style-type: none"> <li>•For using RC oscillator, short between the XIN and XOUT pins, and connect the capacitor and resistor.</li> <li>•If an external clock is used, connect the clock source to the XIN pin and leave the XOUT pin open.</li> <li>•When the on-chip oscillator is selected as the main clock, connect XIN pin to Vcc and leave XOUT open.</li> </ul>	
P00(LED00)/CAP0	I/O port P0	<ul style="list-style-type: none"> <li>•8-bit I/O port.</li> <li>•I/O direction register allows each pin to be individually programmed as either input or output.</li> <li>•CMOS compatible input level</li> <li>•CMOS 3-state output structure</li> <li>•Whether a built-in pull-up resistor is to be used or not can be determined by program.</li> <li>• High drive capacity for LED drive port can be selected by program.</li> </ul>	<ul style="list-style-type: none"> <li>• Capture function pin</li> <li>• Compare function pin</li> <li>• Timer X function pin</li> <li>• Serial I/O2 function pin</li> </ul>

**GROUP EXPANSION**

Renesas plans to expand the 7546 Group as follow:

**Memory type**

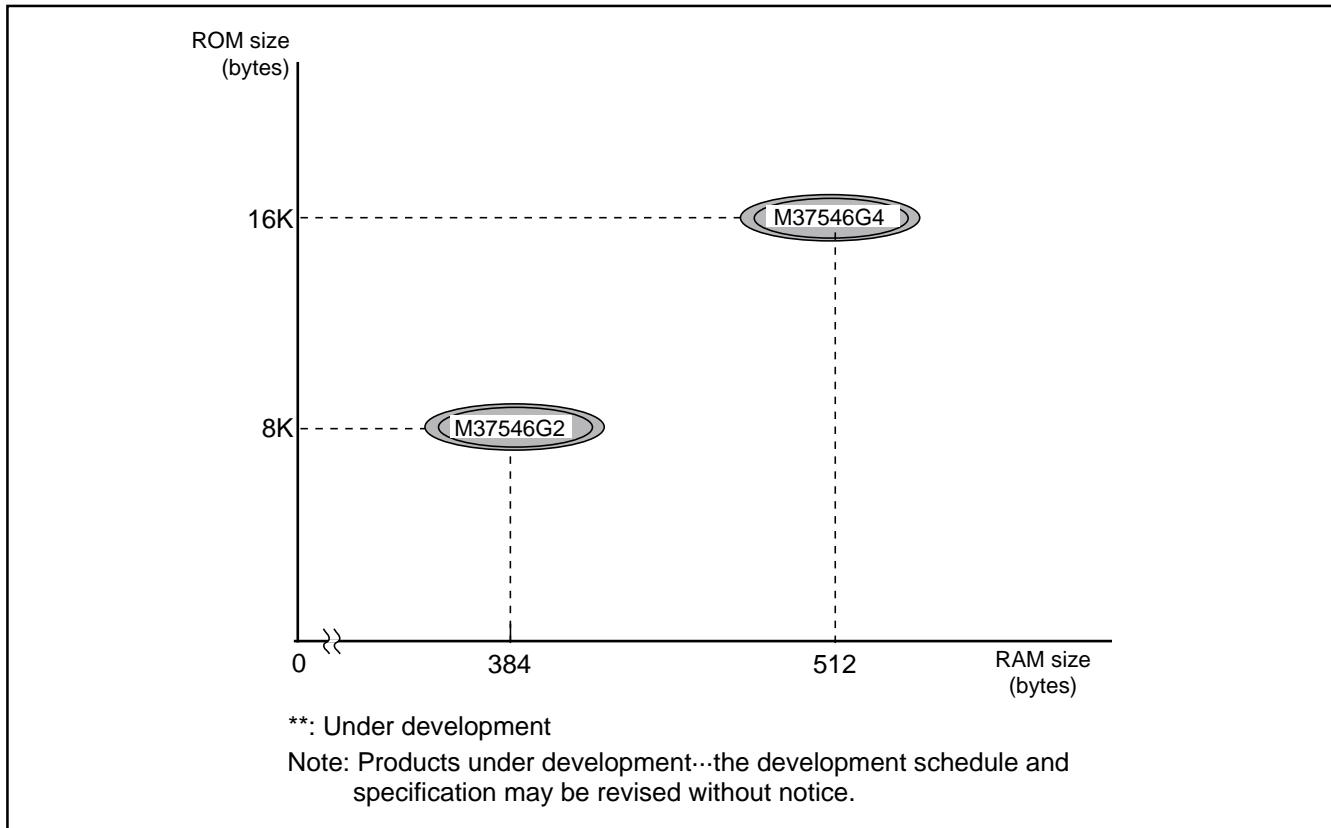

Support for QzROM

**Memory size**

ROM size ..... 8 K to 16 K bytes  
RAM size ..... 384 to 512 bytes

**Package**

PRDP0032BA-A ..... 32-pin plastic molded SDIP  
PLQP0032GB-A ..... 0.8 mm-pitch 32-pin plastic molded LQFP  
PWQN0036KA-A ..... 0.5 mm-pitch 36-pin plastic molded WQFN

**Fig. 7 Memory expansion plan**

Currently supported products are listed below.

**Table 3 List of supported products**

Product	ROM size (bytes) ROM size for User ( )	RAM size (bytes)	Package	Remarks
M37546G2-XXXGP	(Note) 8192 (8062)	384	PLQP0032GB-A	Shipped after writing
M37546G2-XXXHP			PWQN0036KA-A	
M37546G2-XXXSP			PRDP0032BA-A	
M37546G2GP			PLQP0032GB-A	
M37546G2HP			PWQN0036KA-A	
M37546G2SP			PRDP0032BA-A	
M37546G4-XXXGP	(Note) 16384 (16254)	512	PLQP0032GB-A	Shipped after writing

M37546G4GP			PLQP0032GB-A	
M37546G4HP			PWQN0036KA-A	
M37546G4SP			PRDP0032BA-A	

**Note :** ROM size includes the function set ROM.

## FUNCTIONAL DESCRIPTION

### Central Processing Unit (CPU)

The MCU uses the standard 740 family instruction set. Refer to the table of 740 family addressing modes and machine-language instructions or the SERIES 740 <SOFTWARE> USER'S MANUAL for details on each instruction set.

Machine-resident 740 family instructions are as follows:

1. The FST and SLW instructions cannot be used.
2. The MUL and DIV instructions can be used.
3. The WIT instruction can be used.
4. The STP instruction can be used.

### Accumulator (A)

The accumulator is an 8-bit register. Data operations such as data transfer, etc., are executed mainly through the accumulator.

### Index register X (X), Index register Y (Y)

Both index register X and index register Y are 8-bit registers. In the index addressing modes, the value of the OPERAND is added to the contents of register X or register Y and specifies the real address.

When the T flag in the processor status register is set to "1", the value contained in index register X becomes the address for the second OPERAND.

### Stack pointer (S)

The stack pointer is an 8-bit register used during subroutine calls and interrupts. The stack is used to store the current address data and processor status when branching to subroutines or interrupt routines.

The lower eight bits of the stack address are determined by the contents of the stack pointer. The upper eight bits of the stack address are determined by the Stack Page Selection Bit. If the Stack Page Selection Bit is "0", then the RAM in the zero page is used as the stack area. If the Stack Page Selection Bit is "1", then RAM in page 1 is used as the stack area.

The Stack Page Selection Bit is located in the SFR area in the zero page. Note that the initial value of the Stack Page Selection Bit varies with each microcomputer type. Also some microcomputer types have no Stack Page Selection Bit and the upper eight bits of the stack address are fixed. The operations of pushing register contents onto the stack and popping them from the stack are shown in Fig. 9.

### Program counter (PC)

The program counter is a 16-bit counter consisting of two 8-bit registers PCH and PCL. It is used to indicate the address of the next instruction to be executed.

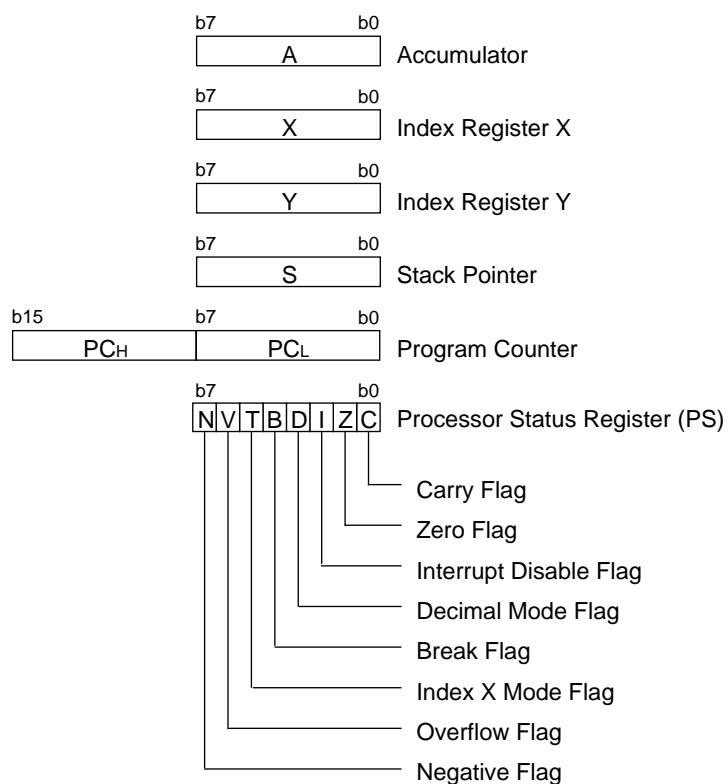

Fig. 8 740 Family CPU register structure

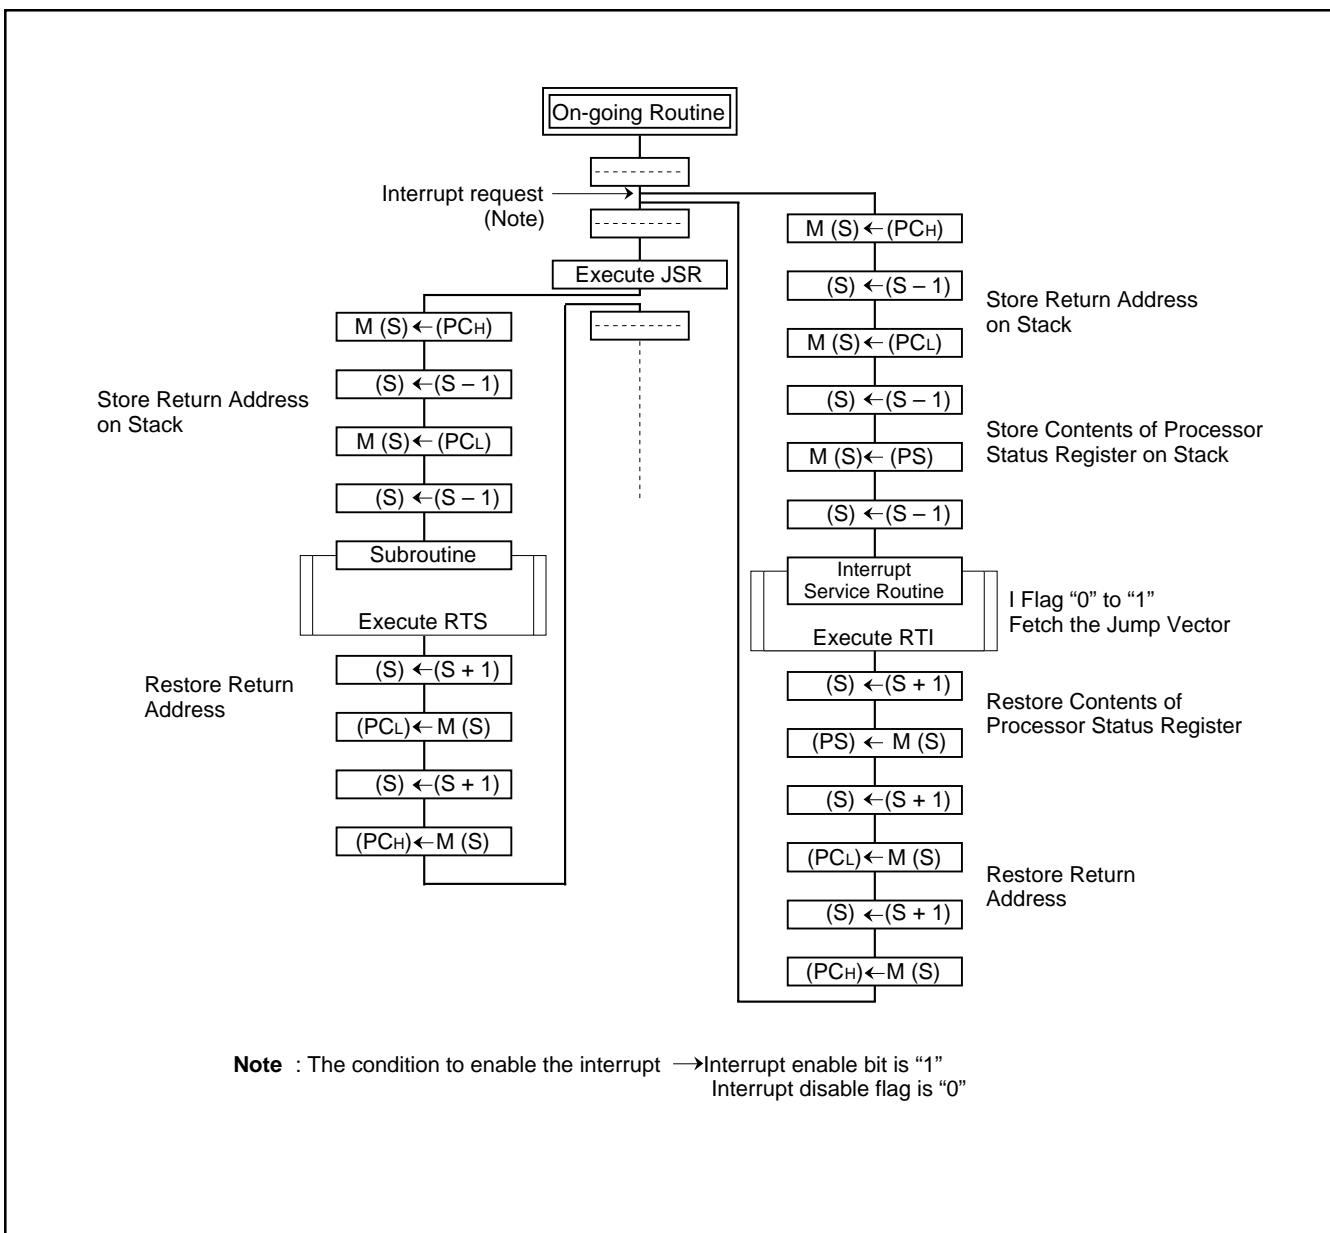

Fig. 9 Register push and pop at interrupt generation and subroutine call

Table 4 Push and pop instructions of accumulator or processor status register

	Push instruction to stack	Pop instruction from stack
Accumulator	PHA	PLA
Processor status register	PHP	PLP

## Processor status register (PS)

The processor status register is an 8-bit register consisting of flags which indicate the status of the processor after an arithmetic operation. Branch operations can be performed by testing the Carry (C) flag, Zero (Z) flag, Overflow (V) flag, or the Negative (N) flag. In decimal mode, the Z, V, N flags are not valid.

After reset, the Interrupt disable (I) flag is set to "1", but all other flags are undefined. Since the Index X mode (T) and Decimal mode (D) flags directly affect arithmetic operations, they should be initialized in the beginning of a program.

### (1) Carry flag (C)

The C flag contains a carry or borrow generated by the arithmetic logic unit (ALU) immediately after an arithmetic operation. It can also be changed by a shift or rotate instruction.

### (2) Zero flag (Z)

The Z flag is set if the result of an immediate arithmetic operation or a data transfer is "0", and cleared if the result is anything other than "0".

### (3) Interrupt disable flag (I)

The I flag disables all interrupts except for the interrupt generated by the BRK instruction. Interrupts are disabled when the I flag is "1".

When an interrupt occurs, this flag is automatically set to "1" to prevent other interrupts from interfering until the current interrupt is serviced.

### (4) Decimal mode flag (D)

The D flag determines whether additions and subtractions are executed in binary or decimal. Binary arithmetic is executed when this flag is "0"; decimal arithmetic is executed when it is "1".

Decimal correction is automatic in decimal mode. Only the ADC and SBC instructions can be used for decimal arithmetic.

### (5) Break flag (B)

The B flag is used to indicate that the current interrupt was generated by the BRK instruction. The BRK flag in the processor status register is always "0". When the BRK instruction is used to generate an interrupt, the processor status register is pushed onto the stack with the break flag set to "1". The saved processor status is the only place where the break flag is ever set.

### (6) Index X mode flag (T)

When the T flag is "0", arithmetic operations are performed between accumulator and memory, e.g. the results of an operation between two memory locations is stored in the accumulator. When the T flag is "1", direct arithmetic operations and direct data transfers are enabled between memory locations, i.e. between memory and memory, memory and I/O, and I/O and I/O. In this case, the result of an arithmetic operation performed on data in memory location 1 and memory location 2 is stored in memory location 1. The address of memory location 1 is specified by index register X, and the address of memory location 2 is specified by normal addressing modes.

### (7) Overflow flag (V)

The V flag is used during the addition or subtraction of one byte of signed data. It is set if the result exceeds +127 to -128. When the BIT instruction is executed, bit 6 of the memory location operated on by the BIT instruction is stored in the overflow flag.

### (8) Negative flag (N)

The N flag is set if the result of an arithmetic operation or data transfer is negative. When the BIT instruction is executed, bit 7 of the memory location operated on by the BIT instruction is stored in the negative flag.

**Table 5 Set and clear instructions of each bit of processor status register**

	C flag	Z flag	I flag	D flag	B flag	T flag	V flag	N flag
Set instruction	SEC	–	SEI	SED	–	SET	–	–
Clear instruction	CLC	–	CLI	CLD	–	CLT	CLV	–

## Memory

### Special function register (SFR) area

The SFR area in the zero page contains control registers such as I/O ports and timers.

### RAM

RAM is used for data storage and for a stack area of subroutine calls and interrupts.

### ROM

The first 128 bytes and the last 2 bytes of ROM are reserved for device testing and the rest is a user area for storing programs.

### Interrupt vector area

The interrupt vector area contains reset and interrupt vectors.

### Zero page

The 256 bytes from addresses 000016 to 00FF16 are called the zero page area. The internal RAM and the special function registers (SFR) are allocated to this area.

The zero page addressing mode can be used to specify memory and register addresses in the zero page area. Access to this area with only 2 bytes is possible in the zero page addressing mode.

### Special page

The 256 bytes from addresses FF0016 to FFFF16 are called the special page area. The special page addressing mode can be used to specify memory addresses in the special page area. Access to this area with only 2 bytes is possible in the special page addressing mode.

### ROM Code Protect Address (address FFDB16)

Address FFDB16, which is the reserved ROM area of QzROM, is the ROM code protect address. "0016" is written into this address when selecting the protect bit write by using a serial programmer or selecting protect enabled for writing shipment by Renesas Technology corp.. When "0016" is set to the ROM code protect address, the protect function is enabled, so that reading or writing from/to QzROM is disabled by a serial programmer.

As for the QzROM product in blank, the ROM code is protected by selecting the protect bit write at ROM writing with a serial programmer.

As for the QzROM product shipped after writing, "0016" (protect enabled) or "FF16" (protect disabled) is written into the ROM code protect address when Renesas Technology corp. performs writing. The writing of "0016" or "FF16" can be selected as the ROM option setup (referred to as "Mask option setup" in MM) when ordering.

### ■ Notes

Because the contents of RAM are indefinite at reset, set initial values before using.

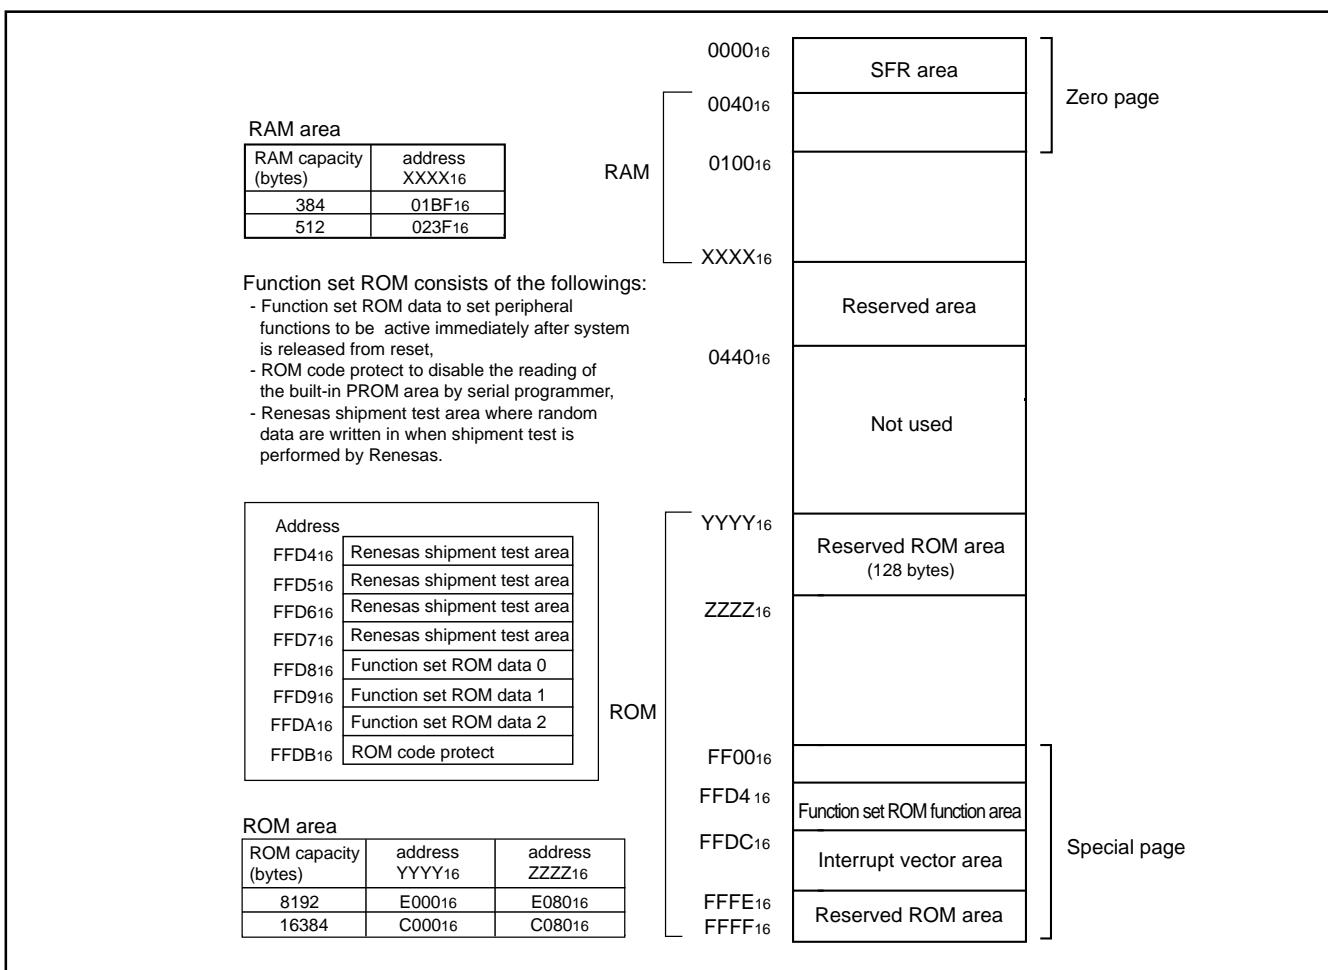

Fig. 10 Memory map diagram

**[CPU mode register] CPUM**

The CPU mode register contains the stack page selection bit, etc..

This register is allocated at address 003B16.

Some function of the CPU mode register can be controlled by the function set ROM data 2.

**Switching method of CPU mode register**

Switch the CPU mode register (CPUM) at the head of program after releasing Reset in the following method.

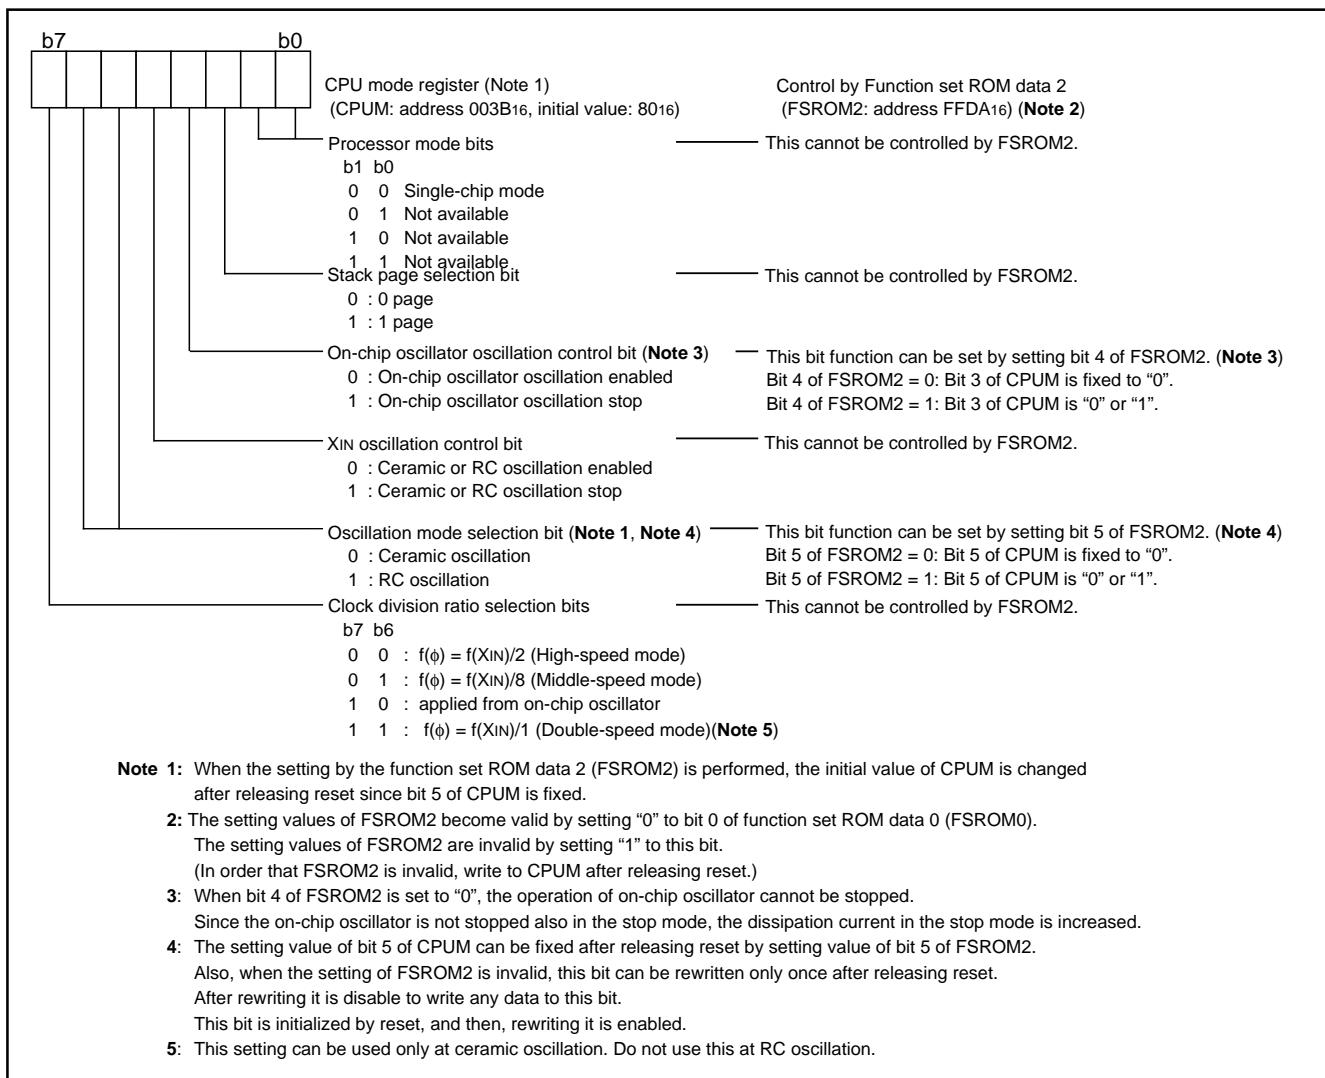

Fig. 11 Structure of CPU mode register

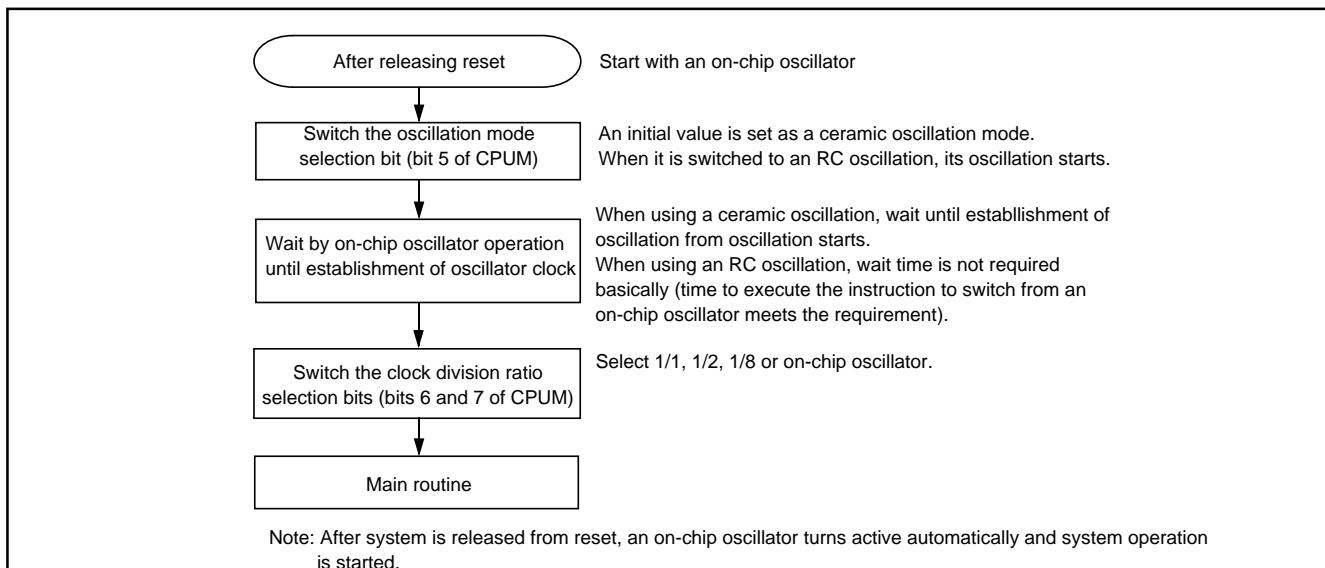

Fig. 12 Switching method of CPU mode register

000016	Port P0 (P0)	002016	Capture mode register (CAPM)
000116	Port P0 direction register (P0D)	002116	Compare output mode register (CMOM)
000216	Port P1 (P1)	002216	Capture/compare status register (CCSR)
000316	Port P1 direction register (P1D)	002316	Compare interrupt source set register (CISR)

001916	Serial I/O1 status register (SIO1STS)	003916	Watchdog timer control register (WDTCON)
001A16	Serial I/O1 control register (SIO1CON)	003A16	Interrupt edge selection register (INTEDGE)
001B16	UART1 control register (UART1CON)	003B16	CPU mode register (CPUM)
001C16	Baud rate generator 1 (BRG1)	003C16	Interrupt request register 1 (IREQ1)
001D16	Timer A, B mode register (TABM)	003D16	Interrupt request register 2 (IREQ2)
001E16	Capture/compare port register (CCPR)	003E16	Interrupt control register 1 (ICON1)
001F16	Timer source selection register (TMSR)	003F16	Interrupt control register 2 (ICON2)

**Notes 1:** Do not access to the SFR area including nothing.

Fig. 13 Memory map of special function register (SFR)

## I/O Ports

### [Direction registers] PiD

The I/O ports have direction registers which determine the input/output direction of each pin. Each bit in a direction register corresponds to one pin, and each pin can be set to be input or output. When "1" is set to the bit corresponding to a pin, this pin becomes an output port. When "0" is set to the bit, the pin becomes an input port.

When data is read from a pin set to output, not the value of the pin itself but the value of port latch is read. Pins set to input are floating, and permit reading pin values.

If a pin set to input is written to, only the port latch is written to and the pin remains floating.

- Set bits 6 and 7 of port P2 direction register to "1".
- Set bits 5 and 6 of port P3 direction register to "1".

### [Port P0P3 drive capacity control register] DCCR

By setting the Port P0P3 drive capacity control register (address 001516), the drive capacity of the N-channel output transistor for the port P0 and port P3 can be selected.

### [Pull-up control register] PULL

By setting the pull-up control register (address 001616), ports P0 and P3 can exert pull-up control by program. However, pins set to output are disconnected from this control and cannot exert pull-up control.

### [Port P1P3 control register] P1P3C

By setting the port P1P3 control register (address 001716), a CMOS input level or a TTL input level can be selected for ports P10, P12, P13, and P37 by program.

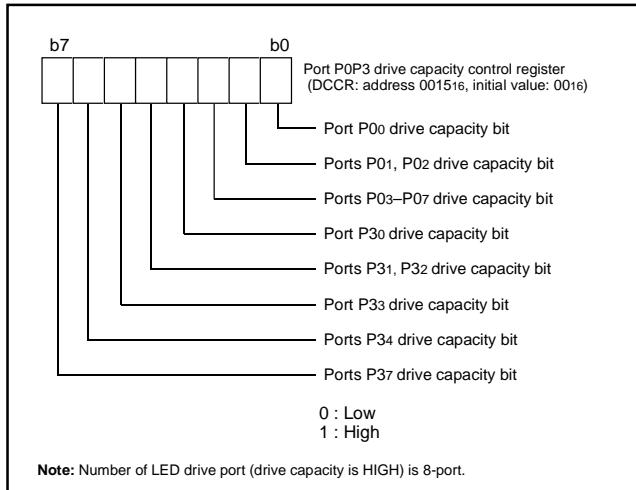

Fig. 14 Structure of port P0P3 drive capacity control register

## Termination of unused pins

- Termination of common pins

I/O ports: Select an input port or an output port and follow each processing method.

Output ports: Open.

Input ports: If the input level become unstable, through current flow to an input circuit, and the power supply current may increase.

Especially, when expecting low consumption current (at STP or WIT instruction execution etc.), pull-up or pull-down input ports to prevent through current (built-in resistor can be used).

We recommend processing unused pins through a resistor which can secure  $I_{OH}(\text{avg})$  or  $I_{OL}(\text{avg})$ .

Because, when an I/O port or a pin which have an output function is selected as an input port, it may operate as an output port by incorrect operation etc.

**Table 7 Termination of unused pins**

Pin	Termination 1 (recommend)	Termination 2	Termination 3	Termination 4
P00/CAP0	I/O port	When selecting CAP function, perform termination of input port.	-	When selecting key-on wakeup function, perform termination of input port.

## Interrupts

Interrupts occur by 18 different sources : 6 external sources, 11 internal sources and 1 software source.

### Interrupt control

All interrupts except the BRK instruction interrupt have an interrupt request bit and an interrupt enable bit, and they are controlled by the interrupt disable flag. When the interrupt enable bit and the interrupt request bit are set to "1" and the interrupt disable flag is set to "0", an interrupt is accepted.

The interrupt request bit can be cleared by program but not be set. The interrupt enable bit can be set and cleared by program.

The reset and BRK instruction interrupt can never be disabled with any flag or bit. All interrupts except these are disabled when the interrupt disable flag is set.

When several interrupts occur at the same time, the interrupts are received according to priority.

### Interrupt operation

Upon acceptance of an interrupt the following operations are automatically performed:

1. The processing being executed is stopped.
2. The contents of the program counter and processor status register are automatically pushed onto the stack.
3. The interrupt disable flag is set and the corresponding interrupt request bit is cleared.
4. Concurrently with the push operation, the interrupt destination address is read from the vector table into the program counter.

### [Interrupt source set register] INTSET

When two interrupt sources are assigned to the same interrupt vector, the valid/invalid of each interrupt is set by this register.

When both two interrupt sources are set to be valid, which interrupt request occurs is confirmed by the next interrupt source discrimination register.

### [Interrupt source discrimination register] INTDIS

When two interrupt sources are assigned to the same interrupt vector, which interrupt source occurs is confirmed by this register.

If an interrupt request of a key-on wakeup, UART1 bus collision detection, A/D conversion or timer 1 occurs, an interrupt discrimination bit is set to "1" regardless of valid/invalid state by the interrupt source set register.

However, when the interrupt valid bit of an interrupt source set register is "0" (invalid), the interrupt request bit of an interrupt control register is not set to "1".

Moreover, since an interrupt discrimination bit is not automatically cleared to "0" by interrupt, please clear it by program.

An interrupt discrimination bit can be cleared to "0" by program but not be set to "1".

### [Interrupt edge selection register] INTEDGE

The valid edge of external interrupt INT0 and INT1 can be selected by the interrupt edge selection bit, respectively.

Set bit 2 of interrupt edge selection register to "1".

#### ■ Notes on use

(1) When setting the followings, the interrupt request bit may be set to "1".

•When switching external interrupt active edge

Related register:

Interrupt edge selection register (address 003A16)

Timer X mode register (address 002B16)

Capture mode register (address 002016)

When not requiring the interrupt occurrence synchronized with these setting, take the following sequence.

- ① Set the corresponding interrupt enable bit to "0" (disabled).
- ② Set the interrupt edge select bit (active edge switch bit, trigger mode bit).
- ③ Set the corresponding interrupt request bit to "0" after 1 or more instructions have been executed.
- ④ Set the corresponding interrupt enable bit to "1" (enabled).

(2) Use a LDM instruction to clear an interrupt discrimination bit.

LDM #\$0n, \$0B

Set the following values to "n"

"0": an interrupt discrimination bit to clear

"1": other interrupt discrimination bits

Ex.) When a key-on wakeup interrupt discrimination bit is cleared;

LDM #00001110B and \$0B.

**Table 8 Interrupt vector address and priority**

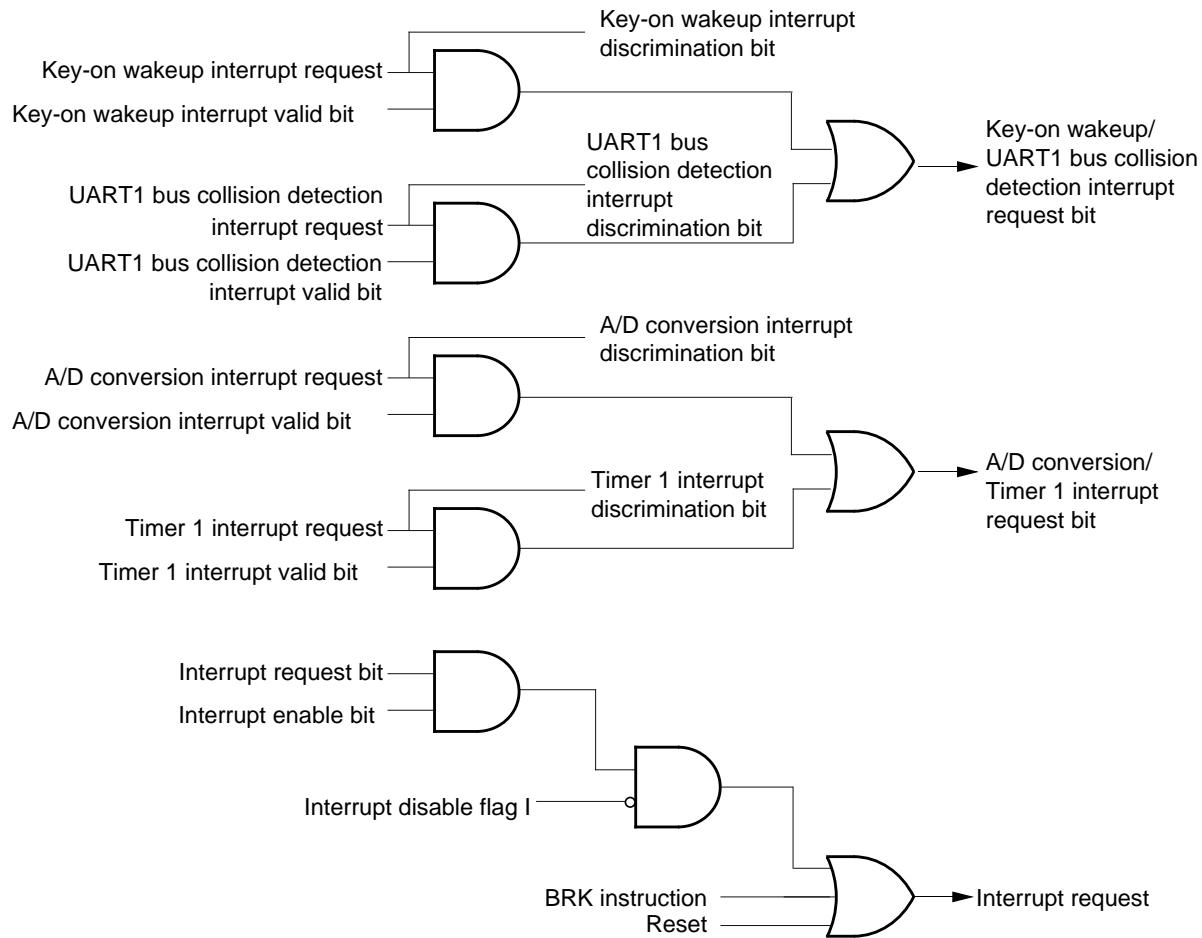

Interrupt source	Priority	Vector addresses (Note 1)		Interrupt request generating conditions	Remarks
		High-order	Low-order		
Reset (Note 2)	1	FFFD16	FFFC16	At reset input	Non-maskable
Serial I/O1 receive	2	FFFB16	FFFA16	At completion of serial I/O1 data receive	Valid only when serial I/O1 is selected
Serial I/O1 transmit	3	FFF916	FFF816	At completion of serial I/O1 transmit shift or when transmit buffer is empty	Valid only when serial I/O1 is selected
Serial I/O2 receive	4	FFF716	FFF616	At completion of serial I/O2 data receive	Valid only when serial I/O2 is selected
Serial I/O2 transmit	5	FFF516	FFF416	At completion of serial I/O2 transmit shift or when transmit buffer is empty	Valid only when serial I/O2 is selected
INT0	6	FFF316	FFF216	At detection of either rising or falling edge of INT0 input	External interrupt (active edge selectable)
INT1	7	FFF116	FFF016	At detection of either rising or falling edge of INT1 input	External interrupt (active edge selectable)
Key-on wake-up/ UART1 bus collision detection (Note 3)	8	FFEF16	FFEE16	At falling of conjunction of input logical level for port P0 (at input) At detection of UART1 bus collision detection	External interrupt (valid at falling, when key-on wakeup interrupt is enabled) When UART1 bus collision detection interrupt is enabled.
CNTR0	9	FFED16	FFEC16	At detection of either rising or falling edge of CNTR0 input	External interrupt (active edge selectable)
Capture 0	10	FFEB16	FFEA16	At detection of either rising or falling edge of Capture 0 input	External interrupt (active edge selectable)
Capture 1	11	FFE916	FFE816	At detection of either rising or falling edge of Capture 1 input	External interrupt (active edge selectable)
Compare	12	FFE716	FFE616	At compare matched	Compare interrupt source is selected.
Timer X	13	FFE516	FFE416	At timer X underflow	
Timer A	14	FFE316	FFE216	At timer A underflow	
Timer B	15	FFE116	FFE016	At timer B underflow	
A/D conversion/ Timer 1 (Note 4)	16	FFDF16	FFDE16	At completion of A/D conversion At timer 1 underflow	When A/D conversion interrupt is enabled. STP release timer underflow (When Timer 1 interrupt is enabled)
BRK instruction	17	FFDD16	FFDC16	At BRK instruction execution	Non-maskable software interrupt

**Note 1:** Vector addressed contain internal jump destination addresses.

**2:** Reset function in the same way as an interrupt with the highest priority.

**3:** Key-on wakeup interrupt and UART1 bus collision detection interrupt can be enabled by setting of interrupt source set register. The occurrence of these interrupts are discriminated by interrupt source discrimination register.

**4:** A/D conversion interrupt and Timer 1 interrupt can be enabled by setting of interrupt source set register. The occurrence of these interrupts are discriminated by interrupt source discrimination register.

**Note:** For key-on wakeup, UART1 bus collision detection, A/D conversion and Timer 1 interrupt, even if interrupt valid bit (000A16) is set "0: Invalid", interrupt discrimination bit (000B16) is set to "1: interrupt occurs" when corresponding interrupt request occurs. But corresponding interrupt request bit (003C16, 003D16) is not set to "1".

Fig. 20 Interrupt control

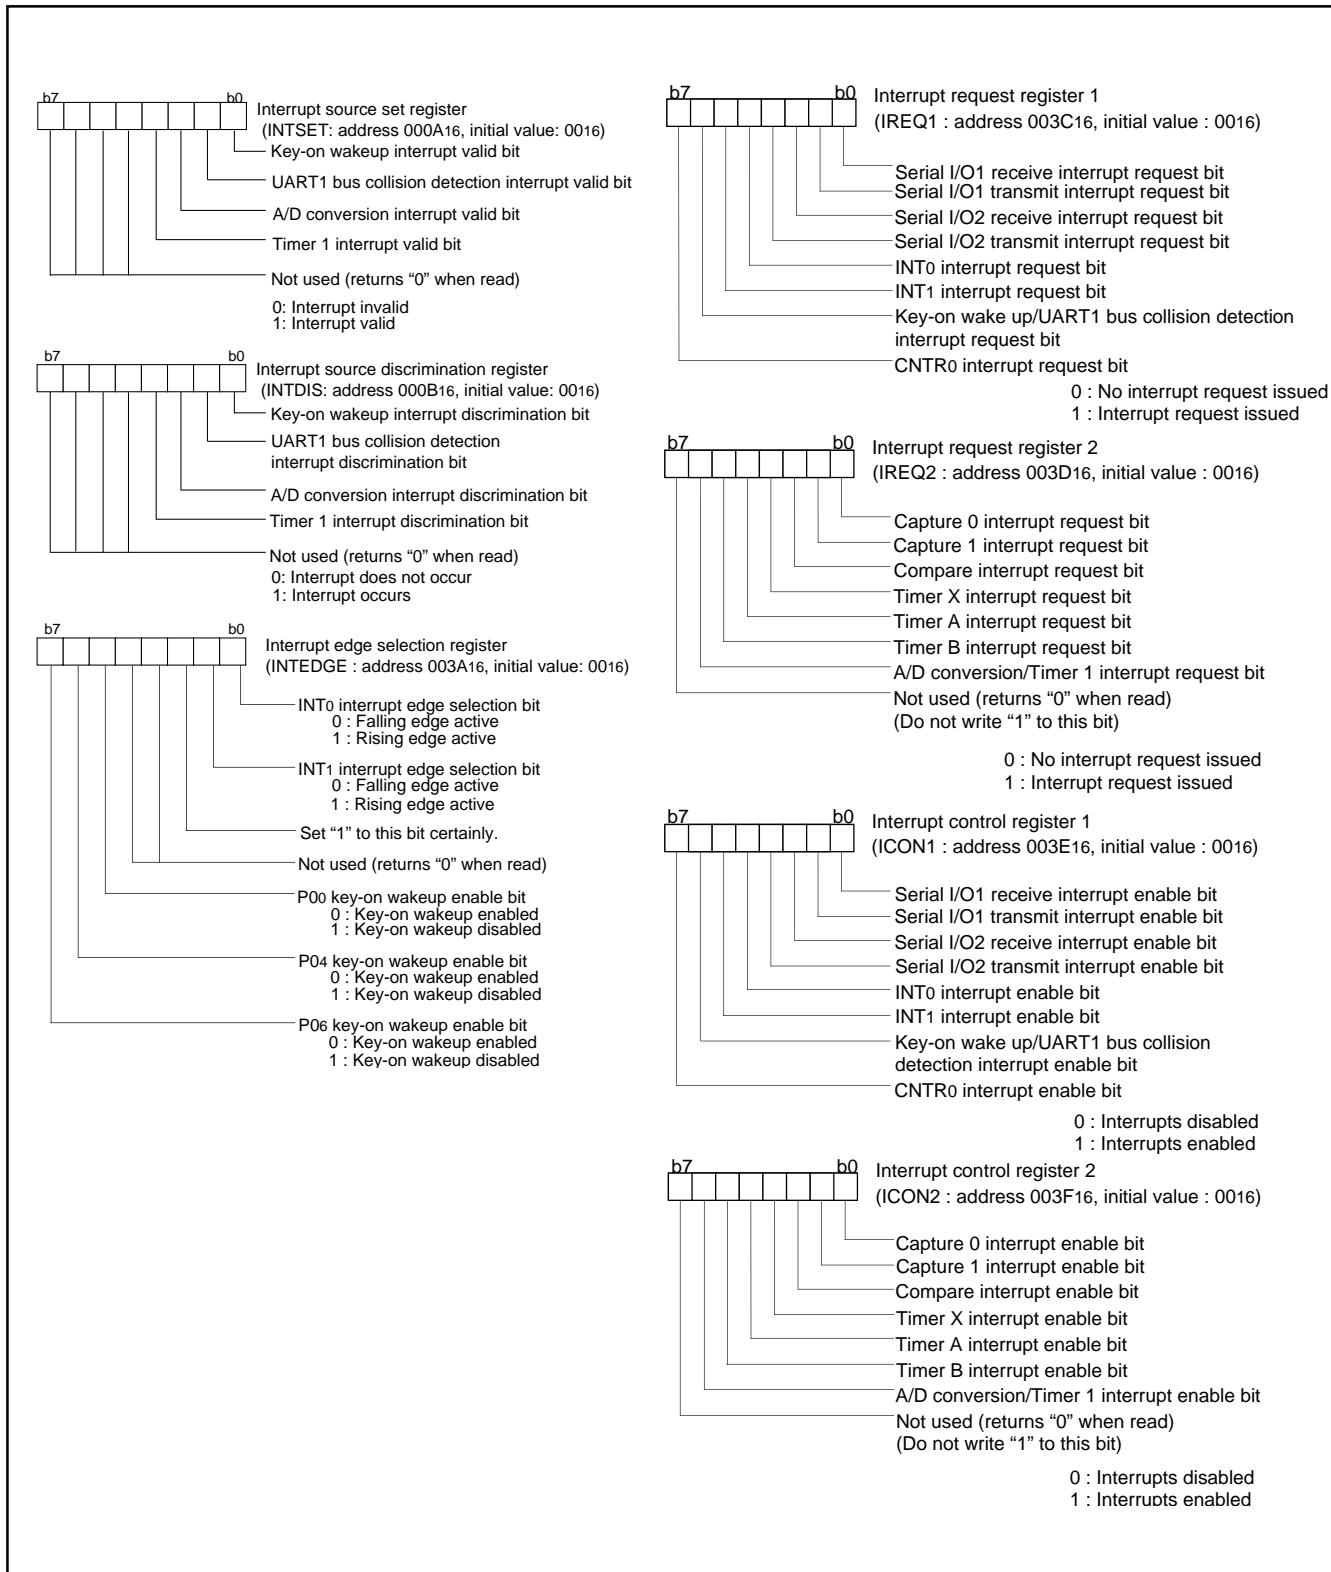

Fig. 21 Structure of Interrupt-related registers

## Key Input Interrupt (Key-On Wake-Up)

A key-on wake-up interrupt request is generated by applying "L" level to any pin of port P0 that has been set to input mode. In other words, it is generated when the AND of input level goes from "1" to "0". An example of using a key input interrupt is shown in Figure 22, where an interrupt request is generated by pressing one of the keys provided as an active-low key matrix which uses ports P00 to P03 as input ports.

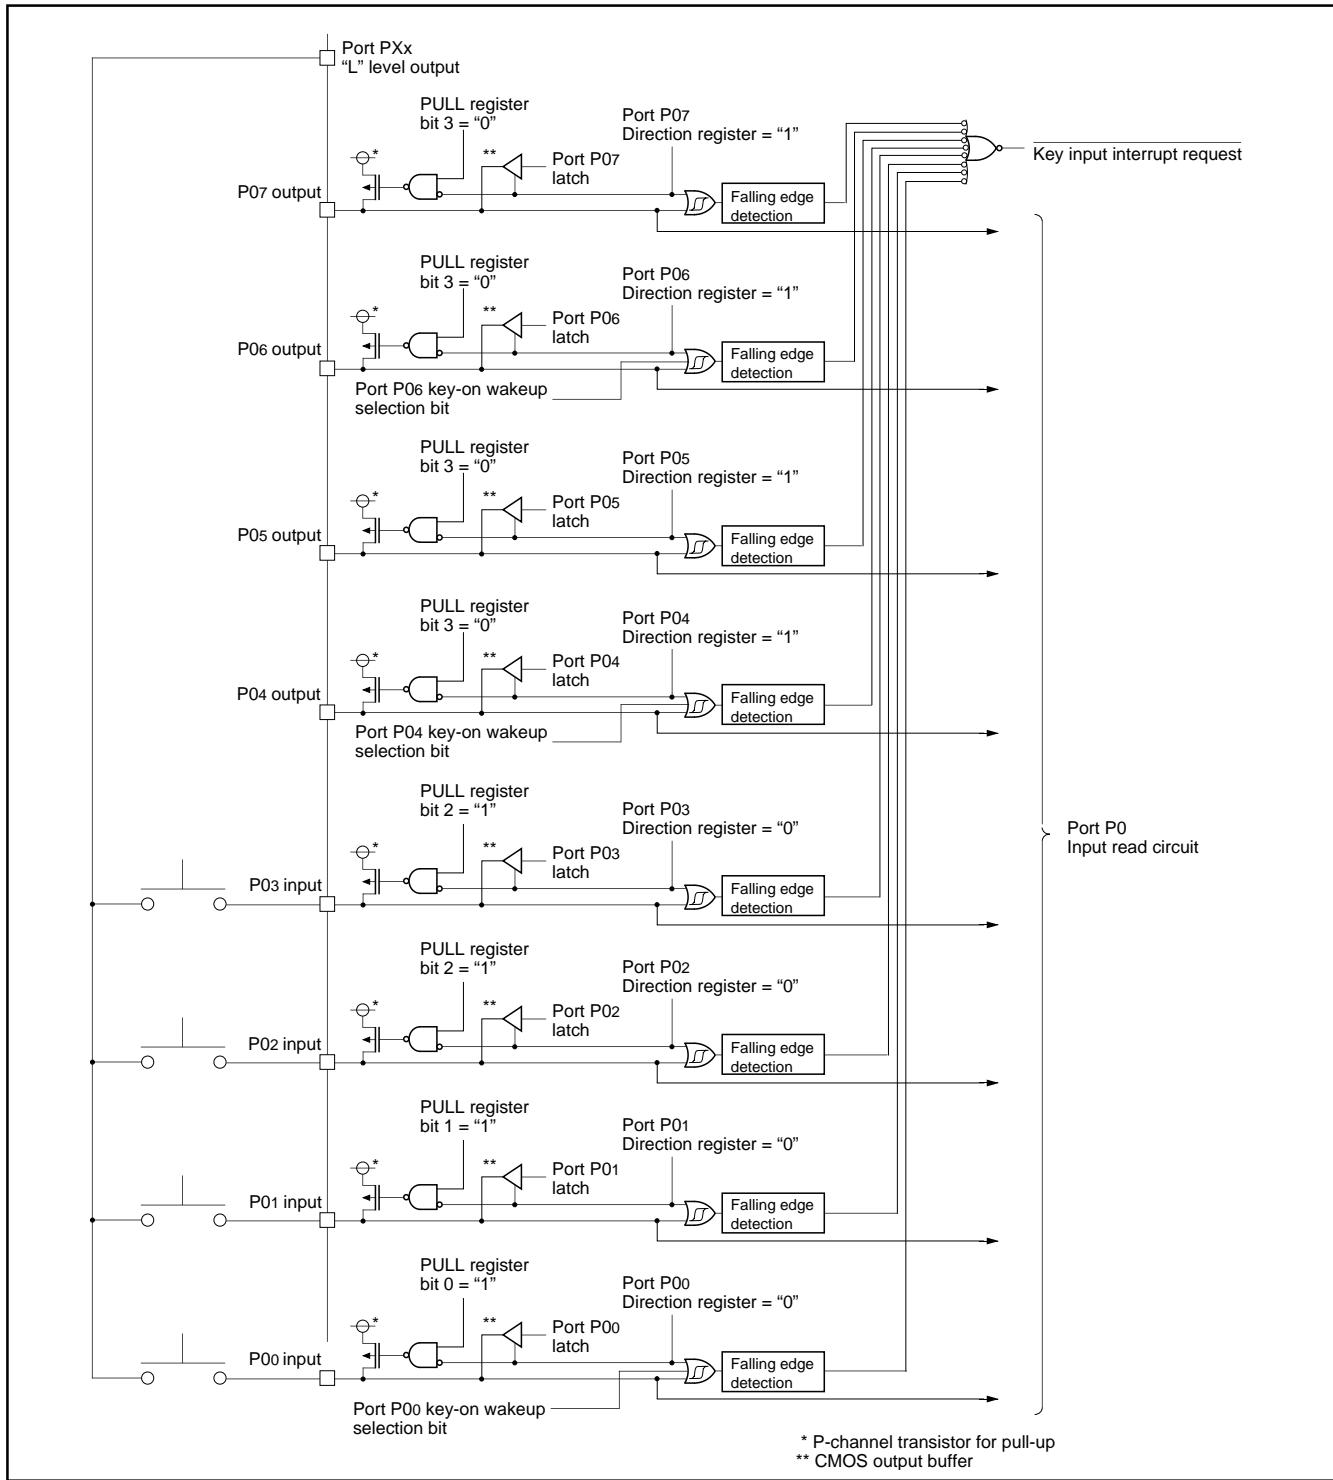

Fig. 22 Connection example when using key input interrupt and port P0 block diagram

## Timers

The 7546 Group has 4 timers: timer 1, timer X, timer A and timer B.

The division ratio of every timer and prescaler is  $1/(n+1)$  provided that the value of the timer latch or prescaler is n.

All the timers are down count timers. When a timer reaches "0", an underflow occurs at the next count pulse, and the corresponding timer latch is reloaded into the timer. When a timer underflows, the interrupt request bit corresponding to each timer is set to "1".

- Frequency divider for timer

According to the clock division selection bits (b7 and b6) of CPU mode register (003B16), the count source of frequency divider is set as follows;

b7b6 = "00"(high-speed), "01"(middle-speed), "11"(double-speed): XIN  
b7b6 = "10"(On-chip oscillator): On-chip oscillator

## ●Timer 1

Timer 1 is an 8-bit timer and counts the prescaler output.

When Timer 1 underflows, the timer 1 interrupt request bit is set to "1".

Prescaler 1 is an 8-bit prescaler and counts the signal which is the oscillation frequency divided by 16.

Prescaler 1 and Timer 1 have the prescaler 1 latch and the timer 1 latch to retain the reload value, respectively. The value of prescaler 1 latch is set to Prescaler 1 when Prescaler 1 underflows. The value of timer 1 latch is set to Timer 1 when Timer 1 underflows.

When writing to Prescaler 1 (PRE1) is executed, the value is written to both the prescaler 1 latch and Prescaler 1.

When writing to Timer 1 (T1) is executed, the value is written to both the timer 1 latch and Timer 1.

When reading from Prescaler 1 (PRE1) and Timer 1 (T1) is executed, each count value is read out.

Timer 1 always operates in the timer mode.

Prescaler 1 counts the signal which is the oscillation frequency divided by 16. Each time the count clock is input, the contents of Prescaler 1 is decremented by 1. When the contents of Prescaler 1 reach "0016", an underflow occurs at the next count clock, and the prescaler 1 latch is reloaded into Prescaler 1 and count continues. The division ratio of Prescaler 1 is  $1/(n+1)$  provided that the value of Prescaler 1 is n.

The contents of Timer 1 is decremented by 1 each time the underflow signal of Prescaler 1 is input. When the contents of Timer 1 reach "0016", an underflow occurs at the next count clock, and the timer 1 latch is reloaded into Timer 1 and count continues. The division ratio of Timer 1 is  $1/(m+1)$  provided that the value of Timer 1 is m. Accordingly, the division ratio of Prescaler 1 and Timer 1 is  $1/((n+1) \times (m+1))$  provided that the value of Prescaler 1 is n and the value of Timer 1 is m.

Timer 1 cannot stop counting by software.

## ●Timer X

Timer X is an 8-bit timer and counts the prescaler X output.

When Timer X underflows, the timer X interrupt request bit is set to "1".

Prescaler X is an 8-bit prescaler and counts the signal selected by the timer X count source selection bit.

Prescaler X and Timer X have the prescaler X latch and the timer X latch to retain the reload value, respectively. The value of prescaler X latch is set to Prescaler X when Prescaler X underflows. The value of timer X latch is set to Timer X when Timer X underflows.

When writing to Prescaler X (PREX) is executed, the value is written to both the prescaler X latch and Prescaler X.

When writing to Timer X (TX) is executed, the value is written to both the timer X latch and Timer X.

When reading from Prescaler X (PREX) and Timer X (TX) is executed, each count value is read out.

Timer X can be selected in one of 4 operating modes by setting the timer X operating mode bits of the timer X mode register.

### (1) Timer mode

Prescaler X counts the count source selected by the timer X count source selection bits. Each time the count clock is input, the contents of Prescaler X is decremented by 1. When the contents of Prescaler X reach "0016", an underflow occurs at the next count clock, and the prescaler X latch is reloaded into Prescaler X and count continues. The division ratio of Prescaler X is  $1/(n+1)$  provided that the value of Prescaler X is n.

The contents of Timer X is decremented by 1 each time the underflow signal of Prescaler X is input. When the contents of Timer X reach "0016", an underflow occurs at the next count clock, and the timer X latch is reloaded into Timer X and count continues. The division ratio of Timer X is  $1/(m+1)$  provided that the value of Timer X is m. Accordingly, the division ratio of Prescaler X and Timer X is  $1/((n+1) \times (m+1))$  provided that the value of Prescaler X is n and the value of Timer X is m.

### (2) Pulse output mode

In the pulse output mode, the waveform whose polarity is inverted each time timer X underflows is output from the CNTR0 pin.

The output level of CNTR0 pin can be selected by the CNTR0 active edge switch bit. When the CNTR0 active edge switch bit is "0", the output of CNTR0 pin is started at "H" level. When this bit is "1", the output is started at "L" level.

Also, the inverted waveform of pulse output from CNTR0 pin can be output from TXOUT pin by setting "1" to the P03/TXOUT output valid bit.

When using a timer in this mode, set the port P14 and P03 direction registers to output mode.

### (3) Event counter mode

The timer A counts signals input from the P14/CNTR0 pin.

Except for this, the operation in event counter mode is the same as in timer mode.

The active edge of CNTR0 pin input signal can be selected from rising or falling by the CNTR0 active edge switch bit.

**(4) Pulse width measurement mode**

In the pulse width measurement mode, the pulse width of the signal input to P14/CNTR0 pin is measured.

The operation of Timer X can be controlled by the level of the signal input from the CNTR0 pin.

When the CNTR0 active edge switch bit is "0", the signal selected by the timer X count source selection bit is counted while the input signal level of CNTR0 pin is "H". The count is stopped while the pin is "L". Also, when the CNTR0 active edge switch bit is "1", the signal selected by the timer X count source selection bit is counted while the input signal level of CNTR0 pin is "L". The count is stopped while the pin is "H".

Timer X can stop counting by setting "1" to the timer X count stop bit in any mode.

Also, when Timer X underflows, the timer X interrupt request bit is set to "1".

Note on Timer X is described below;

**■ Note on Timer X****(1) CNTR0 interrupt active edge selection-1**

CNTR0 interrupt active edge depends on the CNTR0 active edge switch bit.

When this bit is "0", the CNTR0 interrupt request bit is set to "1" at the falling edge of CNTR0 pin input signal. When this bit is "1", the CNTR0 interrupt request bit is set to "1" at the rising edge of CNTR0 pin input signal.

**(2) CNTR0 interrupt active edge selection-2**

According to the setting value of CNTR0 active edge switch bit, the interrupt request bit may be set to "1".

When not requiring the interrupt occurrence synchronized with these setting, take the following sequence.

- ① Set the corresponding interrupt enable bit to "0" (disabled).
- ② Set the active edge switch bit.
- ③ Set the corresponding interrupt request bit to "0" after 1 or more instructions have been executed.
- ④ Set the corresponding interrupt enable bit to "1" (enabled).

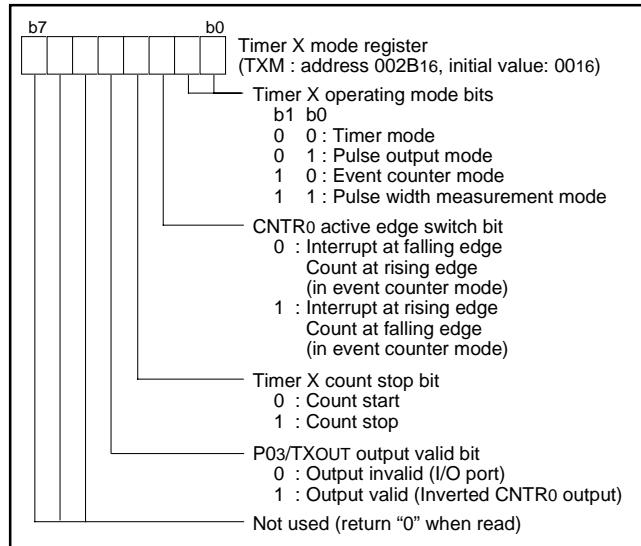

Fig. 23 Structure of timer X mode register

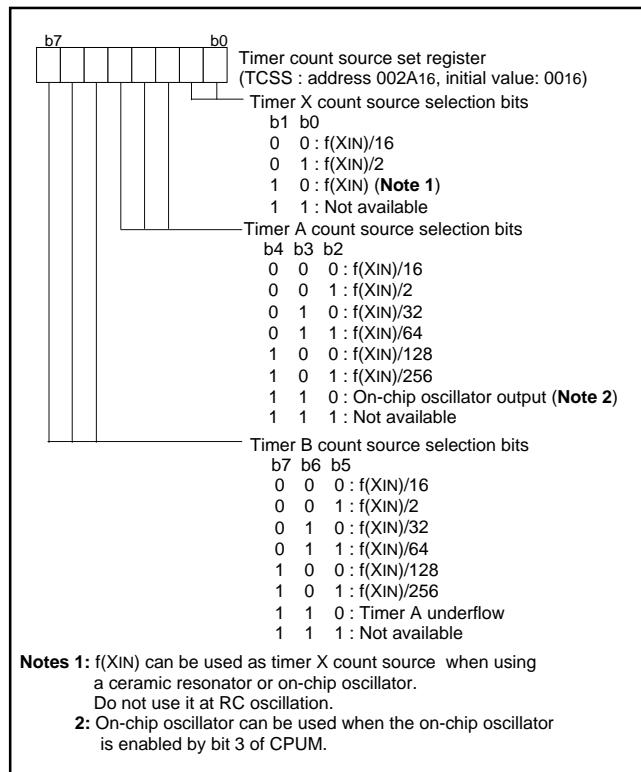

Fig. 24 Timer count source set register

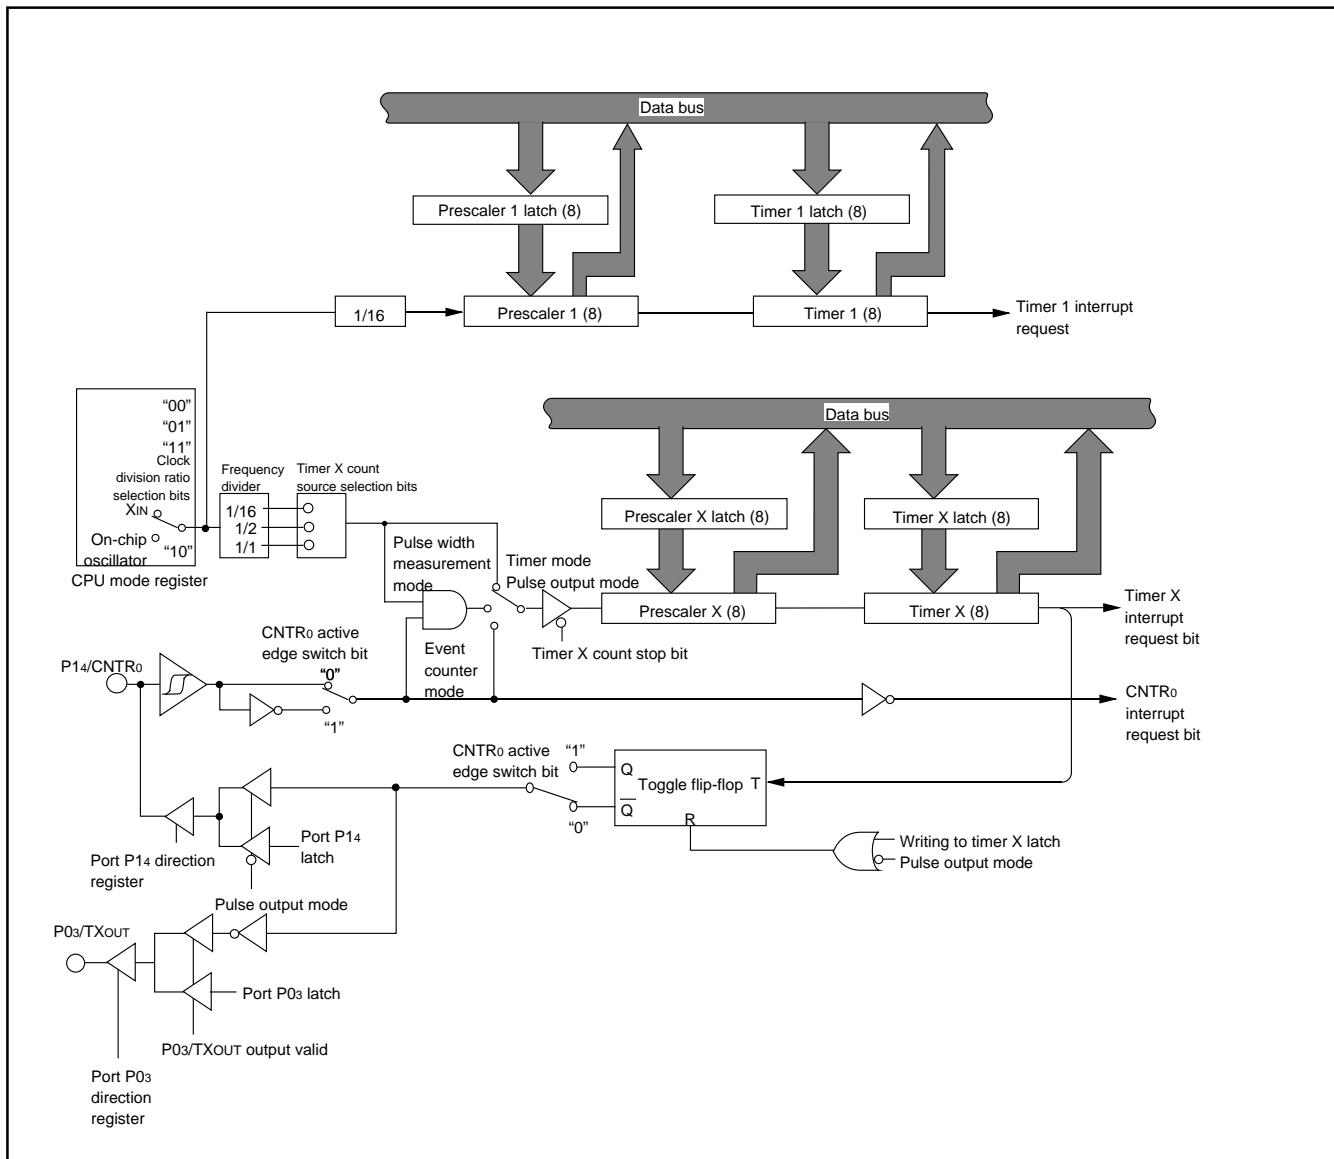

Fig. 25 Block diagram of timer 1 and timer X

## ●Timer A,B

Timer A and Timer B are 16-bit timers and counts the signal which is the oscillation frequency selected by setting of the timer count source set register (TCSS). Timer A and Timer B have the same function except of the count source clock selection.

The count source clock of Timer A is selected from among 1/2, 1/16, 1/32, 1/64, 1/128, 1/256 of f(XIN) clock and on-chip oscillator clock.

The count source clock of Timer B is selected from among 1/2, 1/16, 1/32, 1/64, 1/128, 1/256 of f(XIN) clock and Timer A underflow.

Timer A (B) consists of the low-order of Timer A: TAL (Timer B: TBL) and the high-order of Timer A: TAH (Timer B: TBH). Timer A (B) is decremented by 1 when each time of the count clock is input. When the contents of Timer A (B) reach "000016", an underflow occurs at the next count clock, and the timer latch is re-loaded into timer. When Timer A (B) underflows, the Timer A (B) interrupt request bit is set to "1".

Timer A (B) has the Timer A (B) latch to retain the load value. The value of timer A (B) latch is set to Timer A (B) at the timing of Timer A (B) underflow. The division ratio of Timer A (B) is 1/(n+1) provided that the value of Timer A (B) is n.

When writing to both the low-order of Timer A (B) and the high order of Timer A (B) is executed, writing to "latch only" or "latch and timer" can be selected by the setting value of the timer A (B) write control bit.

When reading from Timer A (B) register is executed, the count value of Timer A (B) is read out.

Be sure to write to/read out the low-order of Timer A (B) and the high-order of Timer A (B) in the following order;

- Read

Read the high-order of Timer A (B) first, and the low-order of Timer A (B) next and be sure to read both high-order and low-order.

- Write

Write to the low-order of Timer A (B) first, and the high-order of Timer A (B) next and be sure to write both low-order and high order.

Timer A and Timer B can be used for the timing timer of Input capture and Output compare function.

## ■ Notes on Timer A, B

### (1) Setting of timer value

When "1: Write to only latch" is set to the timer A (B) write control bit, written data to timer register is set to only latch even if timer is stopped. Accordingly, in order to set the initial value for timer when it is stopped, set "0: Write to latch and timer simultaneously" to timer A (B) write control bit.

### (2) Read/write of timer A

Stop timer A to read/write its data when the system is in the following state;

- CPU operation clock source: XIN oscillation
- Timer A count source: On-chip oscillator output

### (3) Read/write of timer B

Stop timer B to read/write its data when the system is in the following state;

- CPU operation clock source: XIN oscillation
- Timer B count source: Timer A underflow
- Timer A count source: On-chip oscillator output

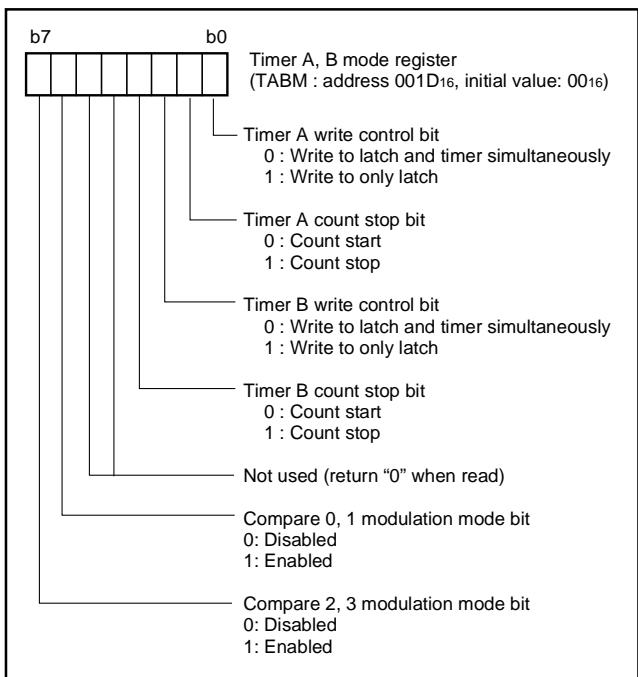

Fig. 26 Structure of timer A, B mode register

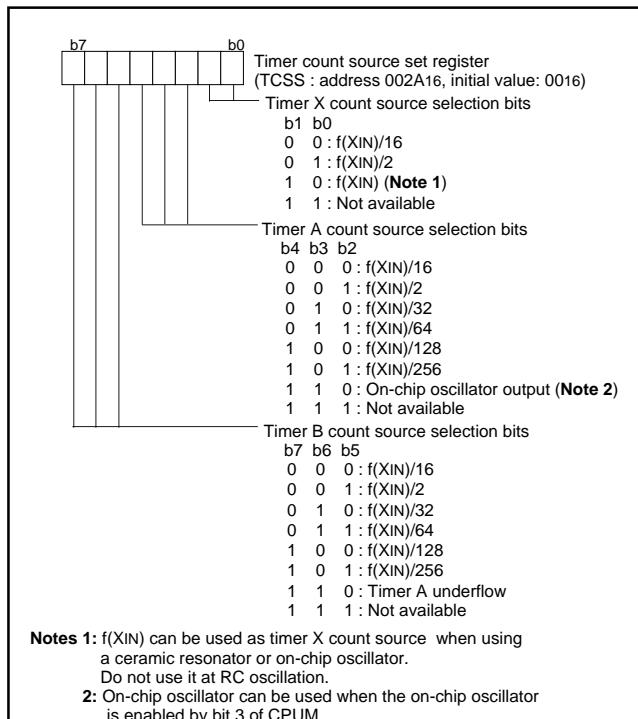

Fig. 27 Timer count source set register

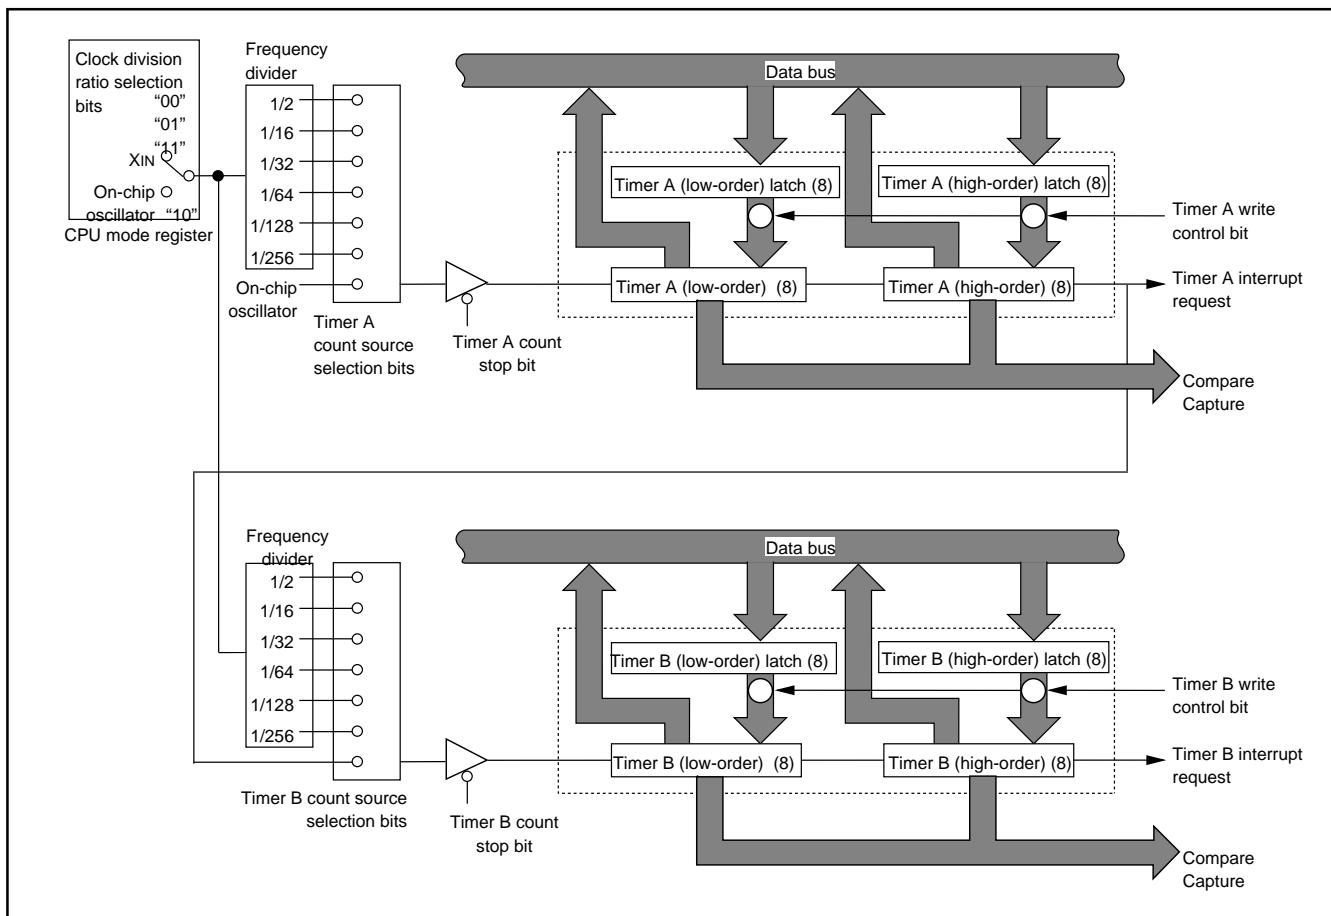

Fig. 28 Block diagram of timer A and timer B

## Output compare

7546 group has 4-output compare channels. Each channel (0 to 3) has the same function and can be used to output waveform by using count value of either Timer A or Timer B.

The source timer for each channel is selected by setting value of the compare x ( $x = 0, 1, 2, 3$ ) timer source bit. Timer A and Timer B can be selected for the source timer to each channel, respectively.

To use each compare channel, set "1" to the compare x output port bit and set the port direction register corresponding to compare channel to output mode.

The compare value for each channel is set to the compare register (low-order) and compare register (high-order).

Writing to the register for each channel is controlled by setting value of compare register write pointer. Writing to each register is in the following order;

1. Set the value of corresponded output compare channel to the compare register write pointer.
2. Write a value to the compare register (low-order) and compare register (high-order).
3. Set "1" to the compare latch y ( $y = 00, 01, 10, 11, 20, 21, 30, 31$ ) re-load bit.

When "1" is set to the compare latch y re-load bit, the value set to the compare register is loaded to compare latch when the next timer underflow.

When count value of timer and setting value of compare latch is matched, compare output trigger occurs.

When "1: Enabled" is set to the compare trigger x enable bit, the output waveform from port is inverted by compare trigger.

When "0: Disabled" is set to the compare trigger x enable bit, the output waveform is not inverted, so port output can be fixed to "H" or "L".

When "0: Positive" is set to the compare x output level latch, the compare output waveform is turned to "H level" at compare latch x0's match and turned to "L level" at compare latch x1's match.

When "1: Negative" is set to the compare x output level latch, the compare output waveform is turned to "L level" at compare latch x0's match and turned to "H level" at compare latch x1's match.

The compare output level of each channel can be confirmed by reading the compare x output status bit.

Compare output interrupt is available when match of each compare channel and timer count value. The interrupt request from each channel can be disabled or enabled by setting value of compare latch y interrupt source bit.

### Compare 0,1 (2,3) modulation mode

In compare modulation mode, modulation waveform can be generated by using compare channel 0 and 1, or compare channel 2 and 3. To use this mode,

- Set "1: Enabled" to the compare 0,1 (2, 3) modulation mode bit.
- Set Timer A underflow for Timer B count source.
- Set Timer A for the timer source of compare channel 0 (2).
- Set Timer B for the timer source of compare channel 1 (3).

In this mode, AND waveform of compare 0 (1) and compare 2 (3) is generated from Port P01 and P31, respectively. Accordingly, in order to use this mode, set "1" to the compare 0 output port bit or compare 2 output port bit.

## ■ Notes on Output Compare

- When the selected source timer of each compare channel is stopped, written data to compare register is loaded to the compare latch simultaneously.
- Do not write the same data to both of compare latch x0 and x1.
- When setting value of the compare latch is larger than timer setting value, compare match signal is not generated. Accordingly, the output waveform is fixed to "L" or "H" level. However, when setting value of another compare latch is smaller than timer setting value, this compare match signal is generated. Accordingly, compare match interrupt occurs.
- When the compare x trigger enable bit is cleared to "0" (disabled), the match trigger to the waveform output circuit is disabled, and the output waveform can be fixed to "L" or "H" level. However, in this case, the compare match signal is generated. Accordingly, compare match interrupt occurs.

**4. When Compare 0 output level latch is “Negative”, Compare 1 output level latch is “Negative”.**

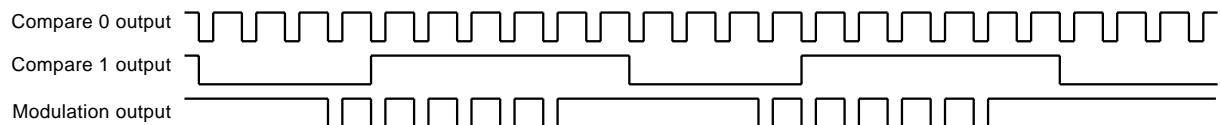

Fig. 42 Output compare mode (compare 0, 1 modulation mode: effect of output level latch)

## Input capture

7546 group has 2-input capture channels. Each channel (0 and 1) has the same function and can be used to capture count value of either Timer A or Timer B.

The source timer for each channel is selected by setting value of the capture x ( $x = 0, 1$ ) timer source bit. Timer A and Timer B can be selected for the source timer to each channel, respectively.

To use each capture channel, set the capture x input port bits and set the port direction register corresponding to capture channel to input mode.

The input capture circuit retains the count value of selected timer when external trigger is input. The timer count value is retained to the capture latch x0 when rising edge is input and is retained to the capture latch x1 when falling edge is input.

The count value of timer can be retained by software by capture y ( $y = 00, 01, 10, 11$ ) software trigger bit too. When "1" is set to this bit, count value of timer is retained to the corresponded capture latch.

When reading from the capture y software trigger bit is executed, "0" is read out.

The latest status of capture latch can be confirmed by reading of the capture x status bit. This bit indicates the capture latch which latest data is in.

The valid trigger edge for capture interrupt is set by the capture x interrupt edge selection bits. (Regardless of the setting value of capture x interrupt edge selection bits, timer count values for both edges are retained to the capture latch.)

Each capture input has the noise filter circuit that judges continuous 4-time same level with sampling clock to be valid. The sampling clock of noise filter is set by the capture x noise filter clock selection bits.

Reading from the register for each channel is controlled by setting value of the capture register read pointer. Reading from each register is in the following order;

1. Set the value of the corresponded input capture channel to the capture register read pointer.
2. Read from the capture register (low-order) and capture register (high-order).

## ■ Notes on Input Capture

- If the capture trigger is input while the capture register (low-order and high-order) is in read, captured value is changed between high-order reading and low-order reading. Accordingly, some countermeasure by program is recommended, for example comparing the values that twice of read.
- When CPU operation clock source is XIN oscillation and the on-chip-oscillator is selected for Timer A count source, Timer A cannot be used for the capture source timer.  
Timer B cannot be used for the capture source timer when the system is in the following state;
  - CPU operation clock source: XIN oscillation
  - Timer B count source: Timer A underflow
  - Timer A count source: On-chip oscillator output
- When writing "1" to capture latch x0 (x1) software trigger bit of capture latch x0 and x1 at the same time, or external trigger and software trigger occur simultaneously, the set value of capture x status bit is undefined.
- When setting the interrupt active edge selection bit and noise filter clock selection bit of external interrupt CAP0, CAP1, the interrupt request bit may be set to "1".  
When not requiring the interrupt occurrence synchronized with these setting, take the following sequence.
  - ① Set the corresponding interrupt enable bit to "0" (disabled).
  - ② Set the interrupt edge selection bit or noise filter clock selection bit.
  - ③ Set the corresponding interrupt request bit to "0" after 1 or more instructions have been executed.
  - ④ Set the corresponding interrupt enable bit to "1" (enabled).
- When the capture interrupt is used as the interrupt for return from stop mode, set the capture x noise filter clock selection bits to "00 (Filter stop)".

## Serial Interface

The 7546 Group has Serial I/O1 and Serial I/O2. Except that Serial I/O1 has the bus collision detection function and the TxD<sub>2</sub> output structure for Serial I/O2 is CMOS only, they have the same function.

### ●Serial I/O1

Serial I/O1 can be used as either clock synchronous or asynchronous (UART) serial I/O. A dedicated timer is also provided for baud rate generation.

#### (1) Clock Synchronous Serial I/O1 Mode

Clock synchronous serial I/O1 mode can be selected by setting the serial I/O1 mode selection bit of the serial I/O1 control register (bit 6) to "1".

For clock synchronous serial I/O1, the transmitter and the receiver must use the same clock. If an internal clock is used, transfer is started by a write signal to the TB/RB.

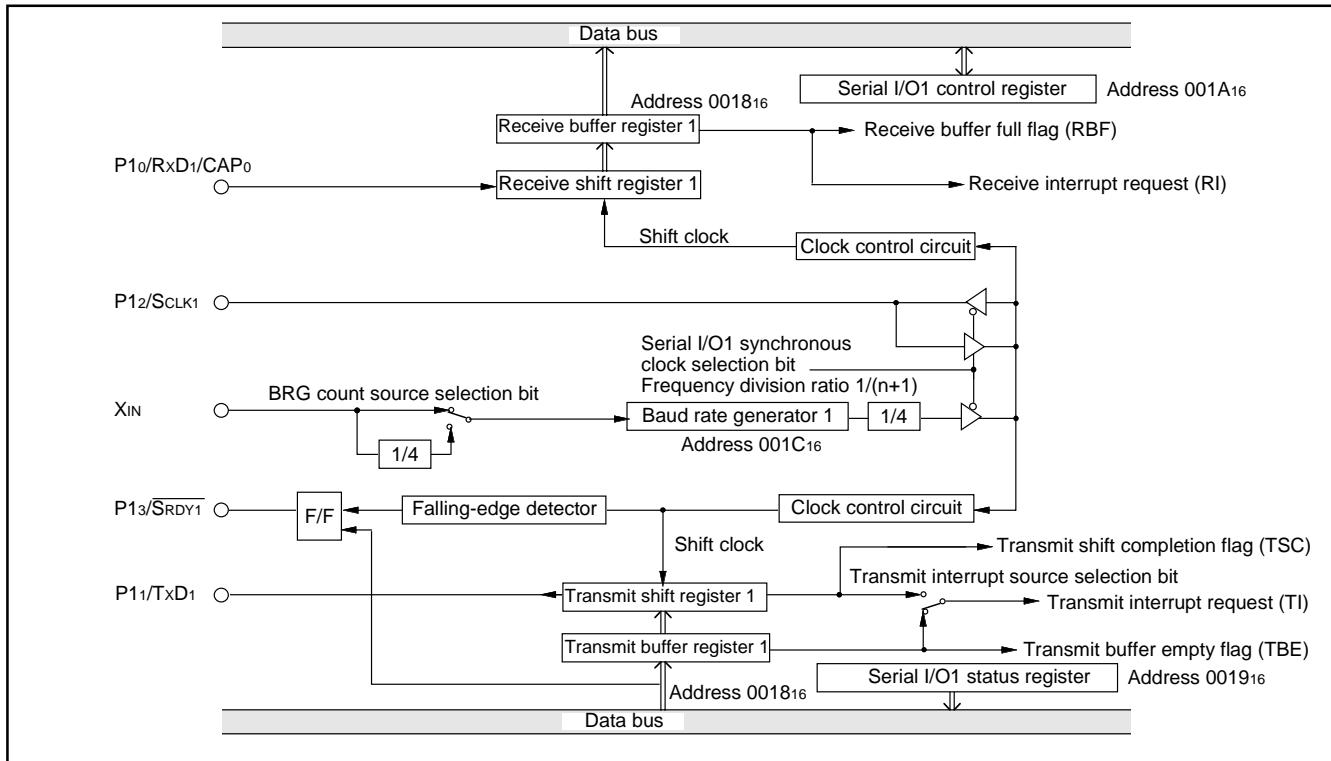

Fig. 49 Block diagram of clock synchronous serial I/O1

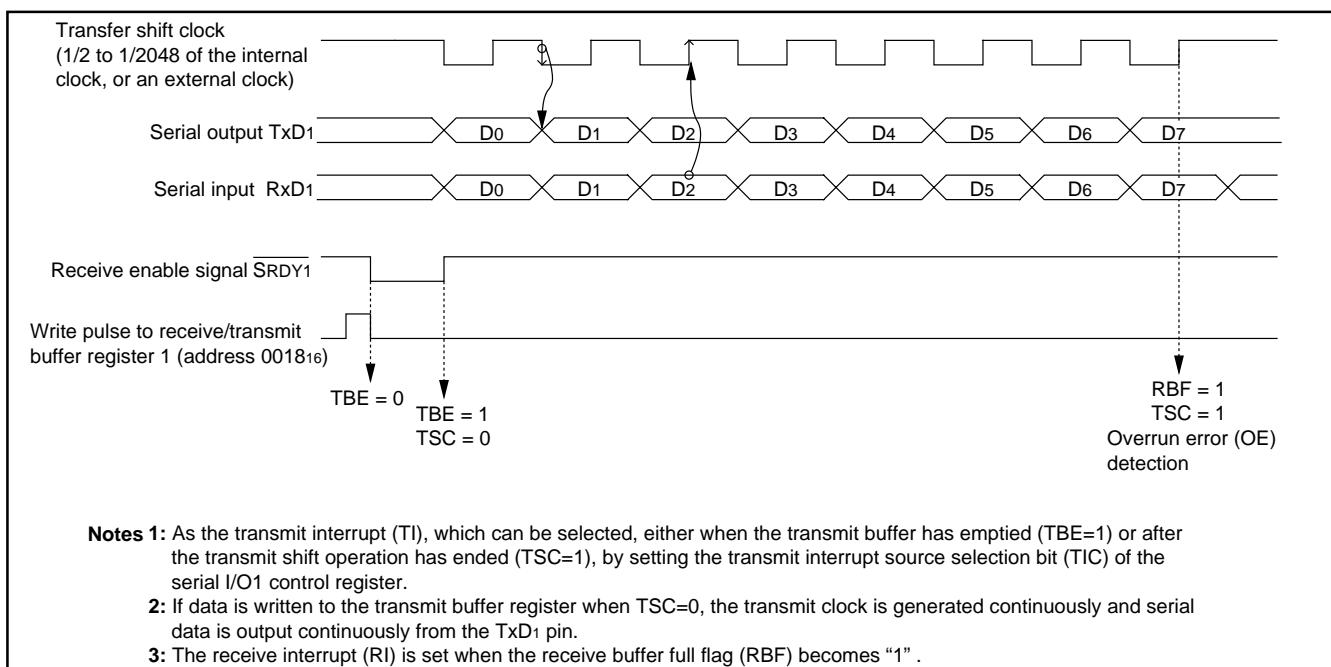

Fig. 50 Operation of clock synchronous serial I/O1 function

## (2) Asynchronous Serial I/O1 (UART) Mode

Clock asynchronous serial I/O mode (UART) can be selected by clearing the serial I/O1 mode selection bit of the serial I/O1 control register to "0".

Eight serial data transfer formats can be selected, and the transfer formats used by a transmitter and receiver must be identical.

The transmit and receive shift registers each have a buffer, but the two buffers have the same address in memory. Since the shift register cannot be written to or read from directly, transmit data is written to the transmit buffer register, and receive data is read from the receive buffer register.

The transmit buffer register can also hold the next data to be transmitted, and the receive buffer register can hold a character while the next character is being received.

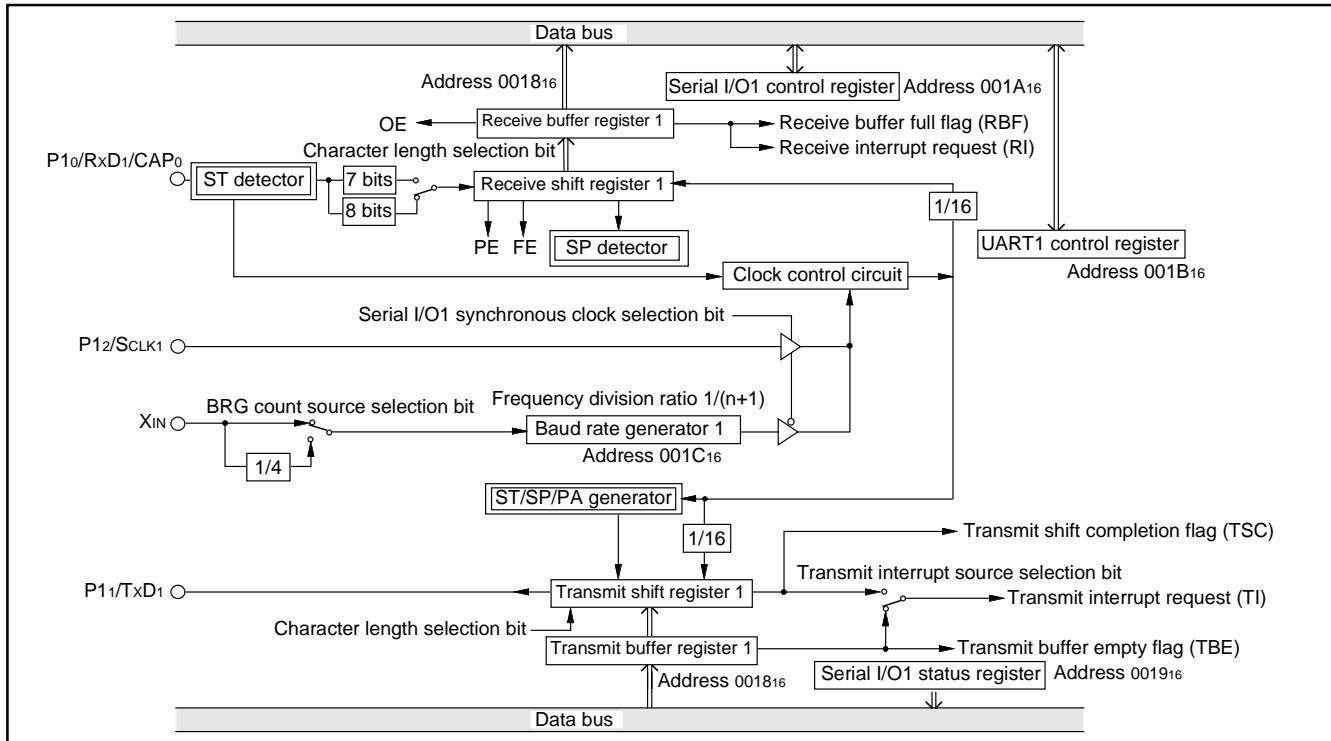

Fig. 51 Block diagram of UART serial I/O1

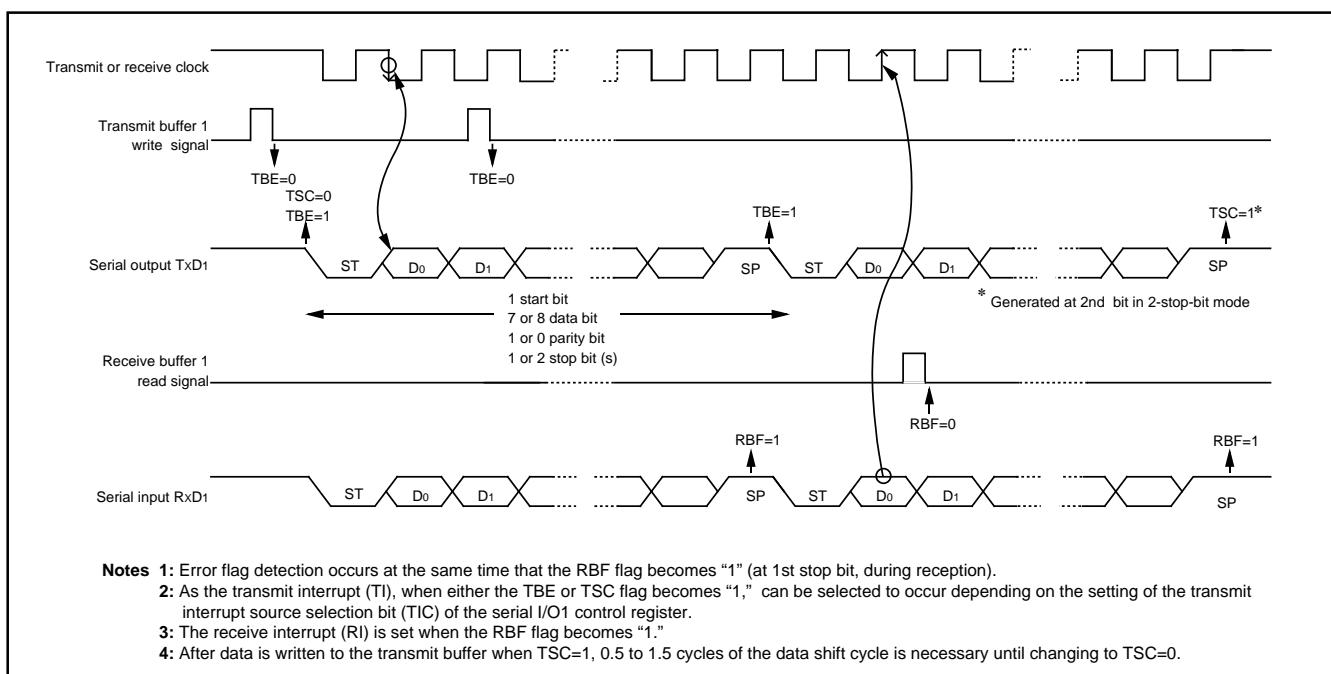

Fig. 52 Operation of UART serial I/O1 function

**[Transmit buffer register 1/receive buffer register 1 (TB1/RB1)] 001816**

The transmit buffer register and the receive buffer register are located at the same address. The transmit buffer is write-only and the receive buffer is read-only. If a character bit length is 7 bits, the MSB of data stored in the receive buffer is "0".

**[Serial I/O1 status register (SIO1STS)] 001916**

The read-only serial I/O1 status register consists of seven flags (bits 0 to 6) which indicate the operating status of the serial I/O1 function and various errors.

Three of the flags (bits 4 to 6) are valid only in UART mode.

The receive buffer full flag (bit 1) is cleared to "0" when the receive buffer register is read.

If there is an error, it is detected at the same time that data is transferred from the receive shift register to the receive buffer register, and the receive buffer full flag is set. A write to the serial I/O1 status register clears all the error flags OE, PE, FE, and SE (bit 3 to bit 6, respectively). Writing "0" to the serial I/O1 enable bit SIOE (bit 7 of the serial I/O1 control register) also clears all the status flags, including the error flags.

Bits 0 to 6 of the serial I/O1 status register are initialized to "0" at reset, but if the transmit enable bit of the serial I/O1 control register has been set to "1", the transmit shift completion flag (bit 2) and the transmit buffer empty flag (bit 0) become "1".

**[Serial I/O1 control register (SIO1CON)] 001A16**

The serial I/O1 control register consists of eight control bits for the serial I/O1 function.

**[UART1 control register (UART1CON)] 001B16**

The UART1 control register consists of four control bits (bits 0 to 3) which are valid when asynchronous serial I/O is selected and set the data format of an data transfer and one bit (bit 4) which is always valid and sets the output structure of the P11/TxD1 pin.

**[Baud rate generator 1 (BRG1)] 001C16**

The baud rate generator determines the baud rate for serial transfer. The baud rate generator divides the frequency of the count source by  $1/(n + 1)$ , where n is the value written to the baud rate generator.

**■ Notes on Serial I/O1****• Serial I/O interrupt**

When setting the transmit enable bit to "1", the serial I/O transmit interrupt request bit is automatically set to "1". When not requiring the interrupt occurrence synchronized with the transmission enabled, take the following sequence.

- ① Set the serial I/O transmit interrupt enable bit to "0" (disabled).
- ② Set the transmit enable bit to "1".
- ③ Set the serial I/O transmit interrupt request bit to "0" after 1 or more instructions have been executed.
- ④ Set the serial I/O transmit interrupt enable bit to "1" (enabled).

**• I/O pin function when serial I/O1 is enabled.**

The functions of P12 and P13 are switched with the setting values of a serial I/O1 mode selection bit and a serial I/O1 synchronous clock selection bit as follows.

**(1) Serial I/O1 mode selection bit → "1" :**

Clock synchronous type serial I/O is selected.

Setup of a serial I/O1 synchronous clock selection bit

"0" : P12 pin turns into an output pin of a synchronous clock.

"1" : P12 pin turns into an input pin of a synchronous clock.

Setup of a SRDY1 output enable bit (SRDY)

"0" : P13 pin can be used as a normal I/O pin.

"1" : P13 pin turns into a SRDY1 output pin.

**(2) Serial I/O1 mode selection bit → "0" :**

Clock asynchronous (UART) type serial I/O is selected.

Setup of a serial I/O1 synchronous clock selection bit

"0" : P12 pin can be used as a normal I/O pin.

"1" : P12 pin turns into an input pin of an external clock.

When clock asynchronous (UART) type serial I/O is selected, it is P13 pin. It can be used as a normal I/O pin.

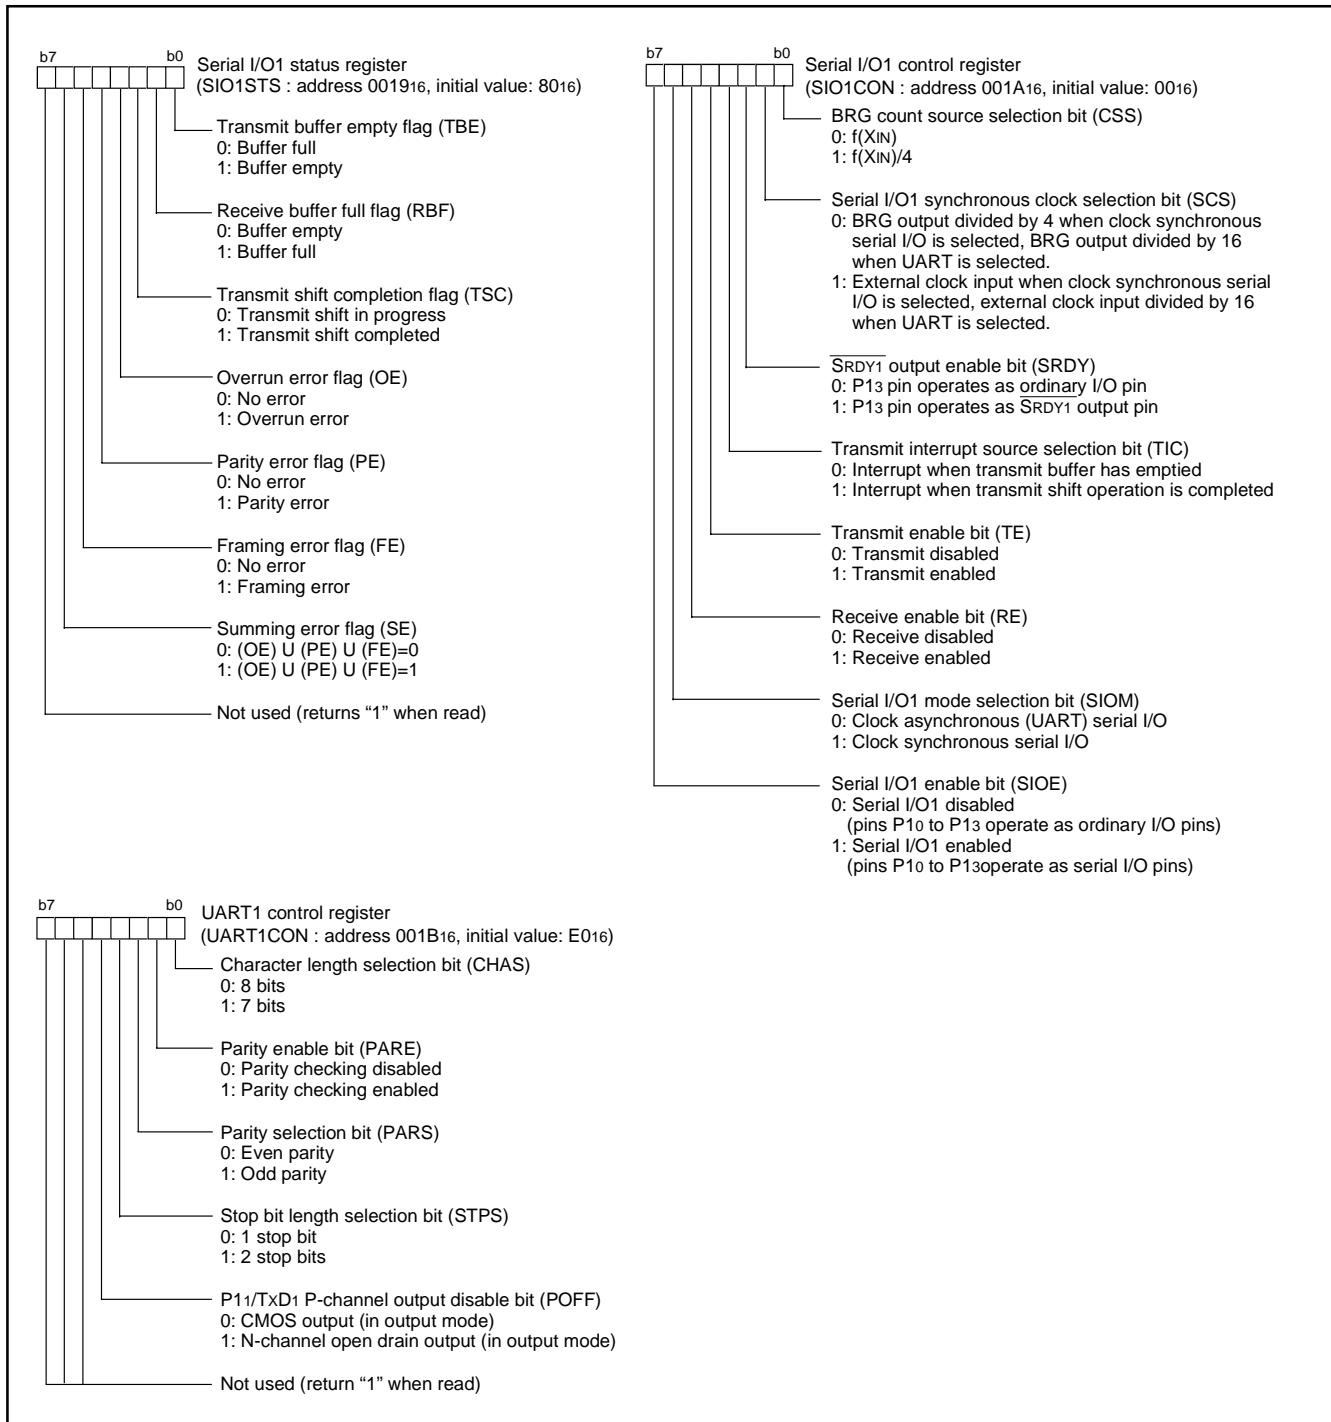

Fig. 53 Structure of serial I/O1-related registers

## Bus collision detection (SIO1)

SIO1 can detect a bus collision by setting UART1 bus collision detection interrupt enable bit.

When transmission is started in the clock synchronous or asynchronous (UART) serial I/O mode, the transmit pin TxD1 is compared with the receive pin RxD1 in synchronization with rising edge of transmit shift clock. If they do not coincide with each other, a bus collision detection interrupt request occurs.

When a transmit data collision is detected between LSB and MSB of transmit data in the clock synchronous serial I/O mode or between the start bit and stop bit of transmit data in UART mode, a bus collision detection can be performed by both the internal clock and the external clock.

A block diagram is shown in Fig. 55.

A timing diagram is shown in Fig. 56.

**Note:** Bus collision detection can be used when SIO1 is operating at full-duplex communication. When SIO1 is operating at half-duplex communication, set bus collision detection interrupt to be disabled.

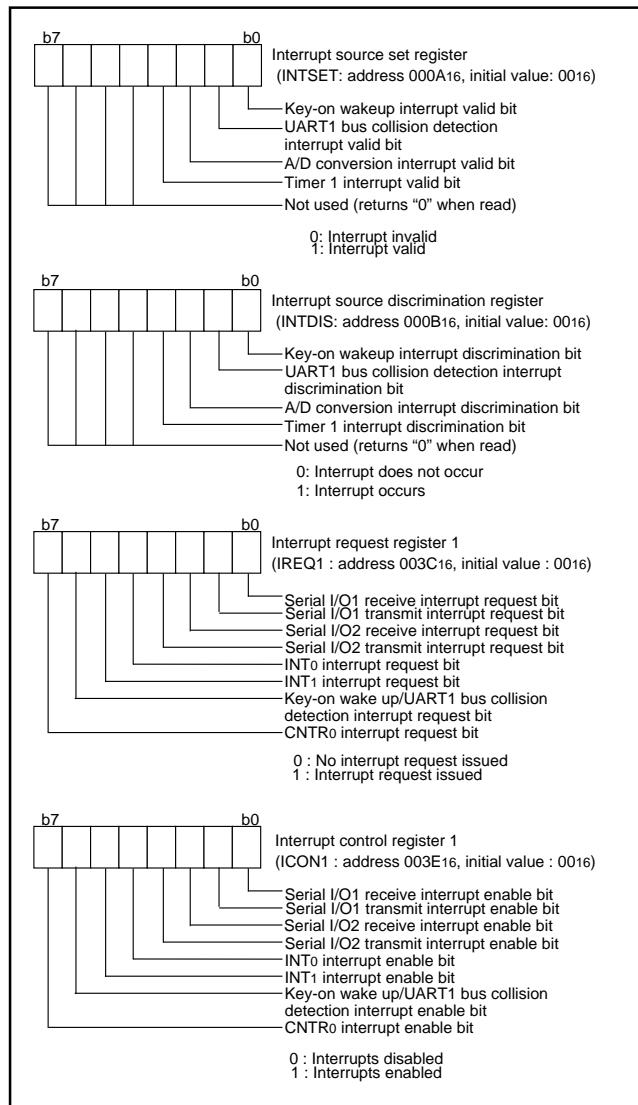

Fig. 54 Bus collision detection circuit related registers

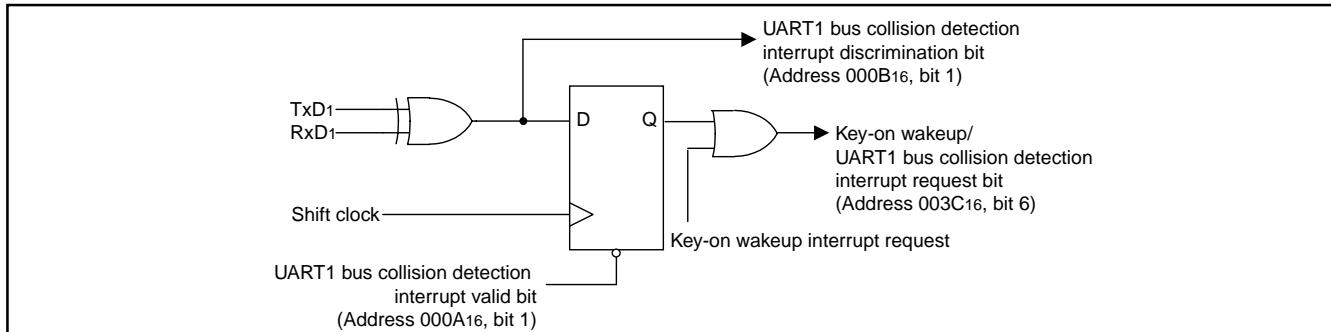

Fig. 55 Block diagram of bus collision detection interrupt circuit

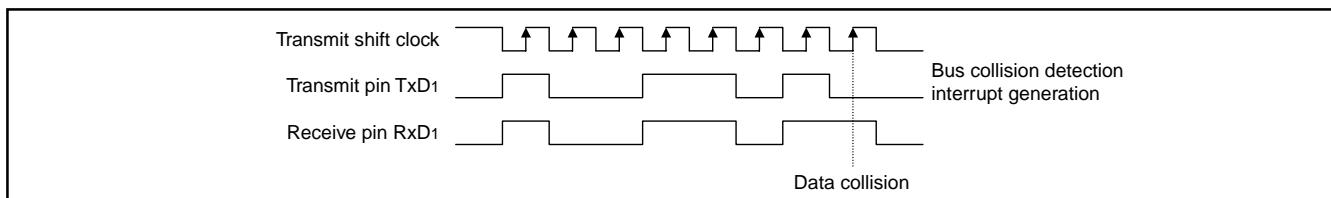

Fig. 56 Timing diagram of bus collision detection interrupt

## ●Serial I/O2

Serial I/O2 can be used as either clock synchronous or asynchronous (UART) serial I/O. A dedicated timer is also provided for baud rate generation.

### (1) Clock Synchronous Serial I/O2 Mode

Clock synchronous serial I/O2 mode can be selected by setting the serial I/O2 mode selection bit of the serial I/O2 control register (bit 6) to "1".

For clock synchronous serial I/O2, the transmitter and the receiver must use the same clock. If an internal clock is used, transfer is started by a write signal to the TB/RB.

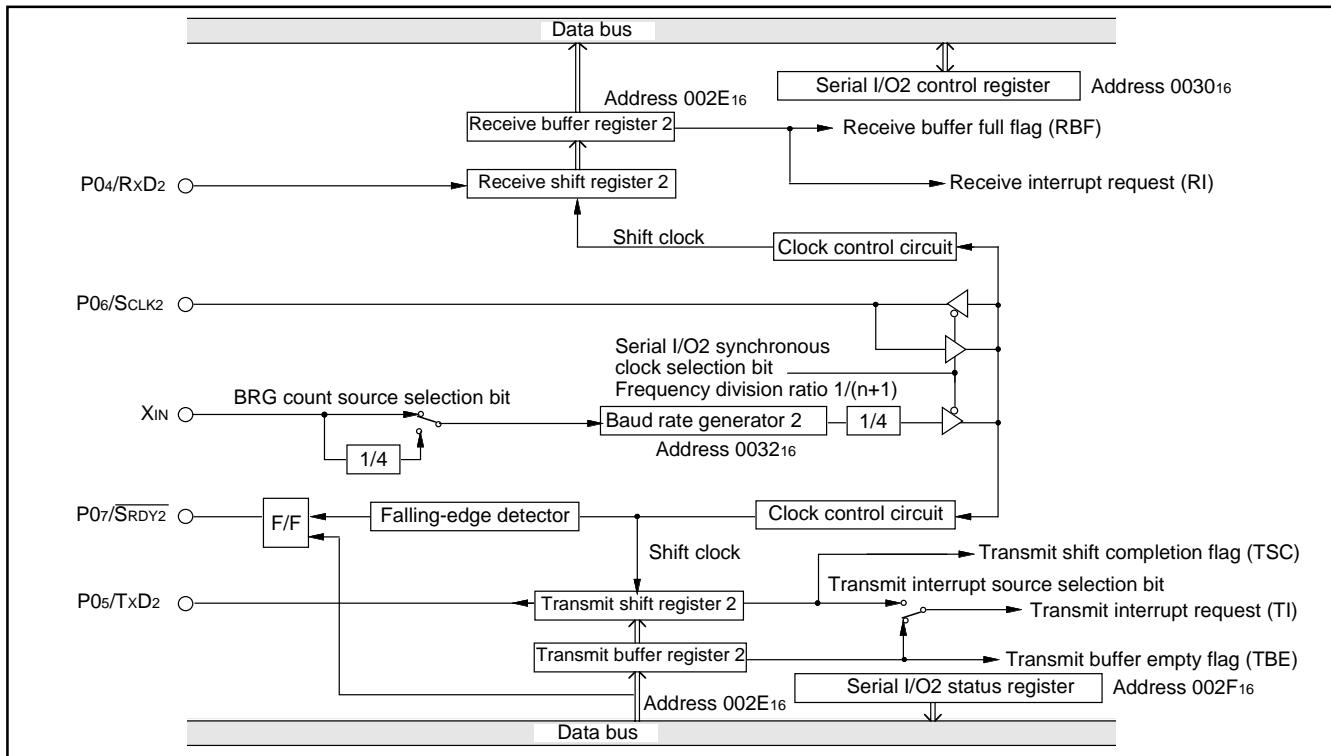

Fig. 57 Block diagram of clock synchronous serial I/O2

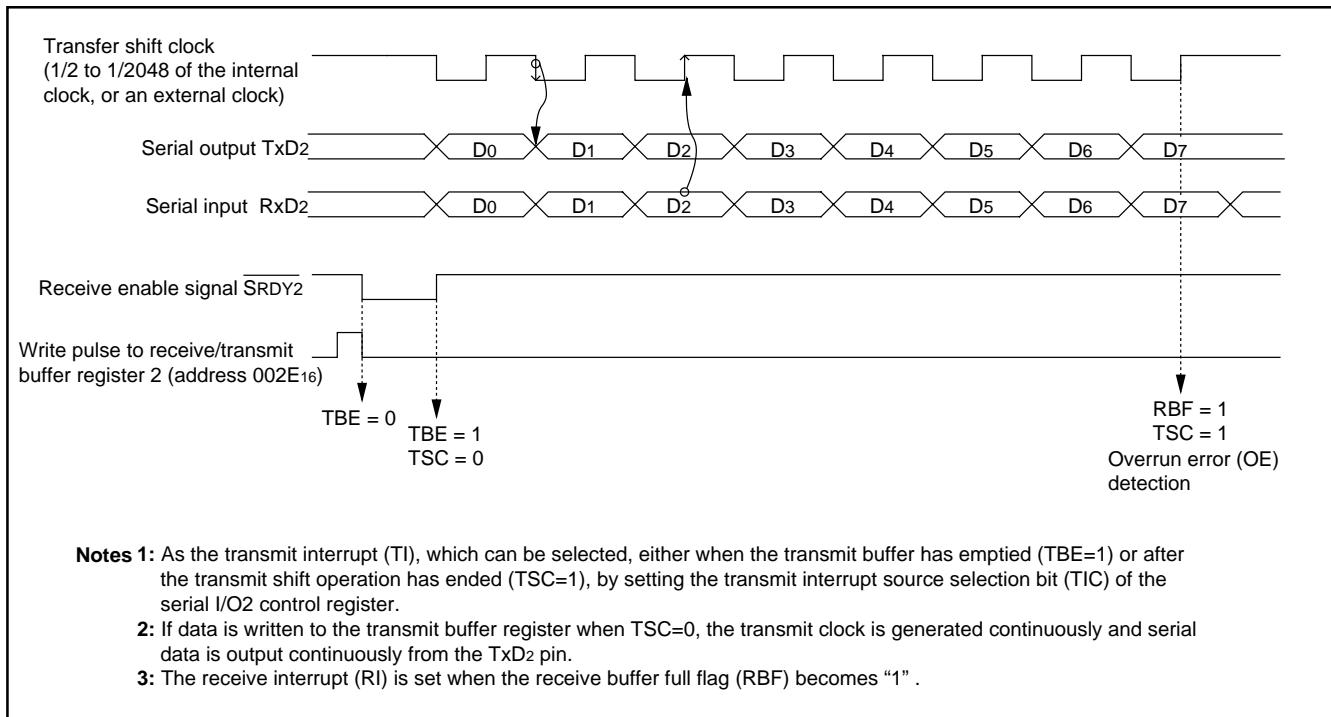

Fig. 58 Operation of clock synchronous serial I/O2 function

## (2) Asynchronous Serial I/O2 (UART) Mode

Clock asynchronous serial I/O mode (UART) can be selected by clearing the serial I/O2 mode selection bit of the serial I/O2 control register to "0".

Eight serial data transfer formats can be selected, and the transfer formats used by a transmitter and receiver must be identical.

The transmit and receive shift registers each have a buffer, but the two buffers have the same address in memory. Since the shift register cannot be written to or read from directly, transmit data is written to the transmit buffer register, and receive data is read from the receive buffer register.

The transmit buffer register can also hold the next data to be transmitted, and the receive buffer register can hold a character while the next character is being received.

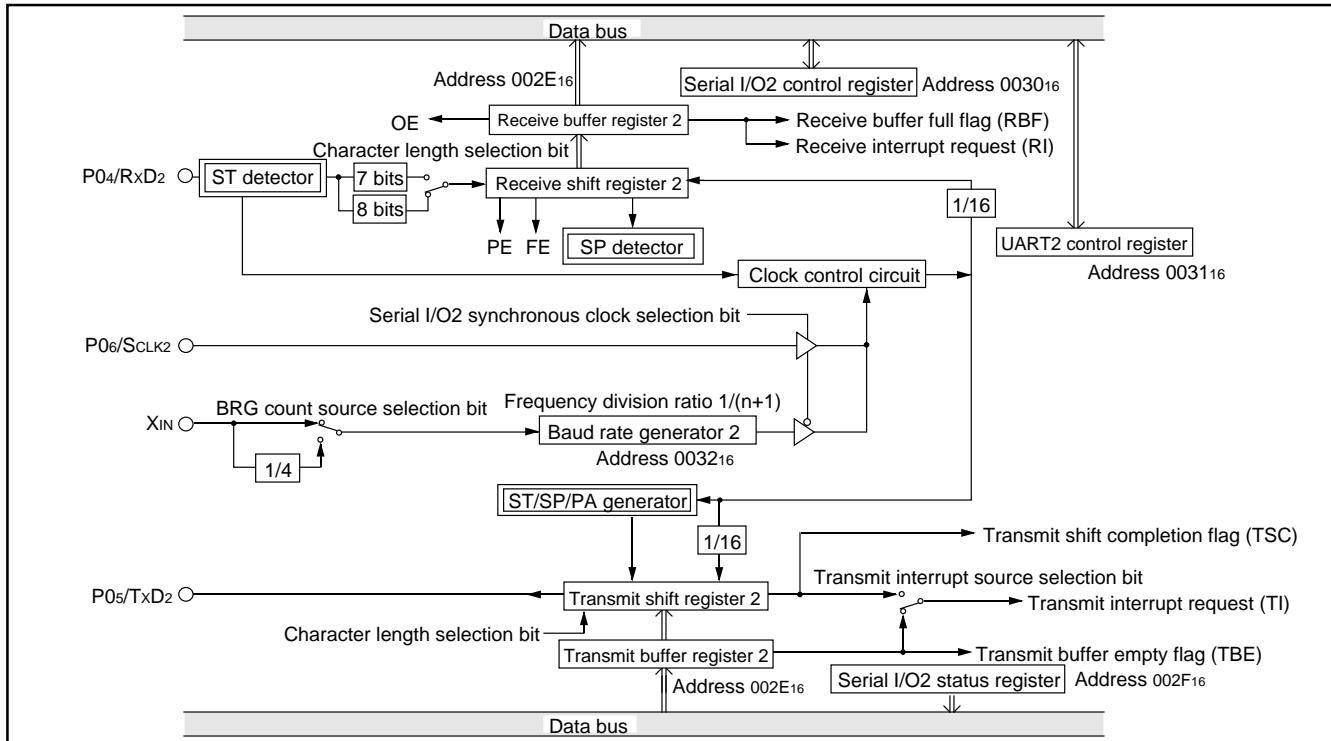

Fig. 59 Block diagram of UART serial I/O2

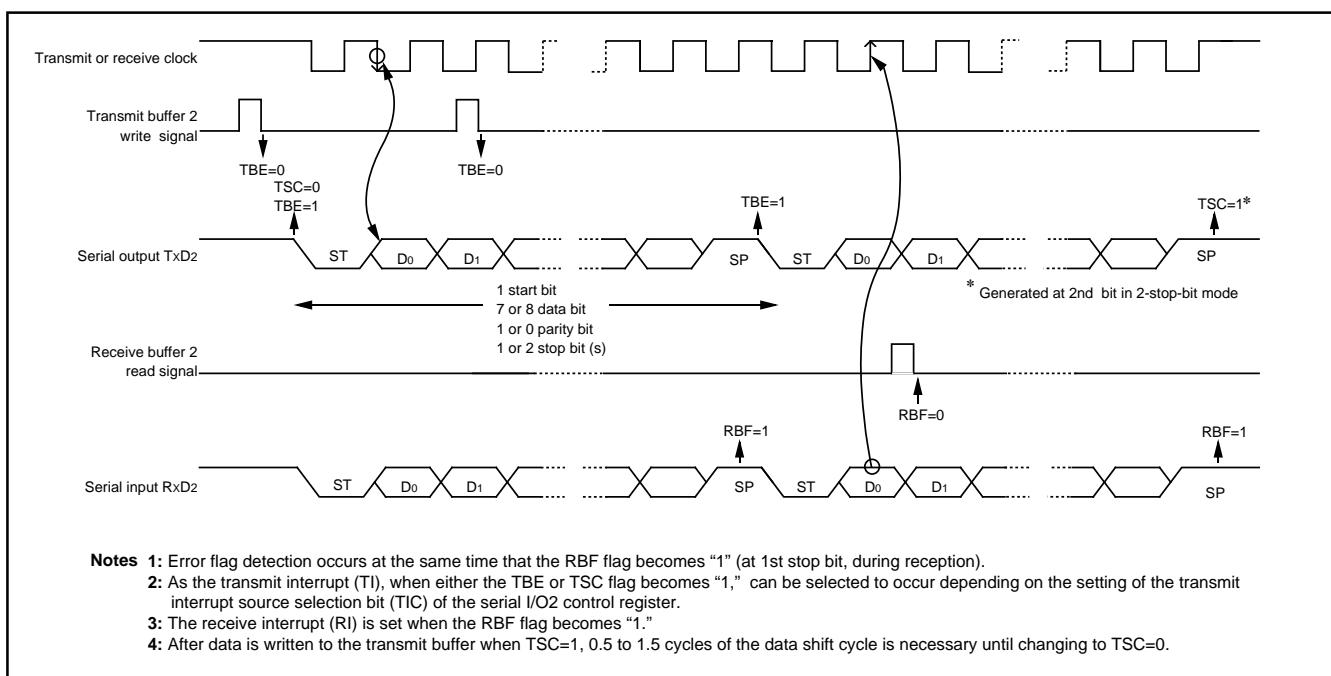

Fig. 60 Operation of UART serial I/O2 function

**[Transmit buffer register 2/receive buffer register 2 (TB2/RB2)] 002E16**

The transmit buffer register and the receive buffer register are located at the same address. The transmit buffer is write-only and the receive buffer is read-only. If a character bit length is 7 bits, the MSB of data stored in the receive buffer is "0".

**[Serial I/O2 status register (SIO2STS)] 002F16**

The read-only serial I/O2 status register consists of seven flags (bits 0 to 6) which indicate the operating status of the serial I/O2 function and various errors.

Three of the flags (bits 4 to 6) are valid only in UART mode.

The receive buffer full flag (bit 1) is cleared to "0" when the receive buffer register is read.

If there is an error, it is detected at the same time that data is transferred from the receive shift register to the receive buffer register, and the receive buffer full flag is set. A write to the serial I/O1 status register clears all the error flags OE, PE, FE, and SE (bit 3 to bit 6, respectively). Writing "0" to the serial I/O2 enable bit SIOE (bit 7 of the serial I/O2 control register) also clears all the status flags, including the error flags.

Bits 0 to 6 of the serial I/O2 status register are initialized to "0" at reset, but if the transmit enable bit of the serial I/O2 control register has been set to "1", the transmit shift completion flag (bit 2) and the transmit buffer empty flag (bit 0) become "1".

**[Serial I/O2 control register (SIO2CON)] 003016**

The serial I/O2 control register consists of eight control bits for the serial I/O2 function.

**[UART2 control register (UART2CON)] 003116**

The UART control register consists of four control bits (bits 0 to 3) which are valid when asynchronous serial I/O is selected and set the data format of an data transfer.

**[Baud rate generator 2 (BRG2)] 003216**

The baud rate generator determines the baud rate for serial transfer. The baud rate generator divides the frequency of the count source by  $1/(n + 1)$ , where n is the value written to the baud rate generator.

**■ Notes on Serial I/O2****• Serial I/O interrupt**

When setting the transmit enable bit to "1", the serial I/O transmit interrupt request bit is automatically set to "1". When not requiring the interrupt occurrence synchronized with the transmission enabled, take the following sequence.

- ① Set the serial I/O transmit interrupt enable bit to "0" (disabled).
- ② Set the transmit enable bit to "1".
- ③ Set the serial I/O transmit interrupt request bit to "0" after 1 or more instructions have been executed.
- ④ Set the serial I/O transmit interrupt enable bit to "1" (enabled).

**• I/O pin function when serial I/O2 is enabled.**

The functions of P06 and P07 are switched with the setting values of a serial I/O2 mode selection bit and a serial I/O2 synchronous clock selection bit as follows.

**(1) Serial I/O2 mode selection bit → "1" :**

Clock synchronous type serial I/O is selected.

Setup of a serial I/O2 synchronous clock selection bit

"0" : P06 pin turns into an output pin of a synchronous clock.

"1" : P06 pin turns into an input pin of a synchronous clock.

Setup of a SRDY2 output enable bit (SRDY)

"0" : P07 pin can be used as a normal I/O pin.

"1" : P07 pin turns into a SRDY2 output pin.

**(2) Serial I/O2 mode selection bit → "0" :**

Clock asynchronous (UART) type serial I/O is selected.

Setup of a serial I/O2 synchronous clock selection bit

"0" : P06 pin can be used as a normal I/O pin.

"1" : P06 pin turns into an input pin of an external clock.

When clock asynchronous (UART) type serial I/O is selected, it is P07 pin. It can be used as a normal I/O pin.

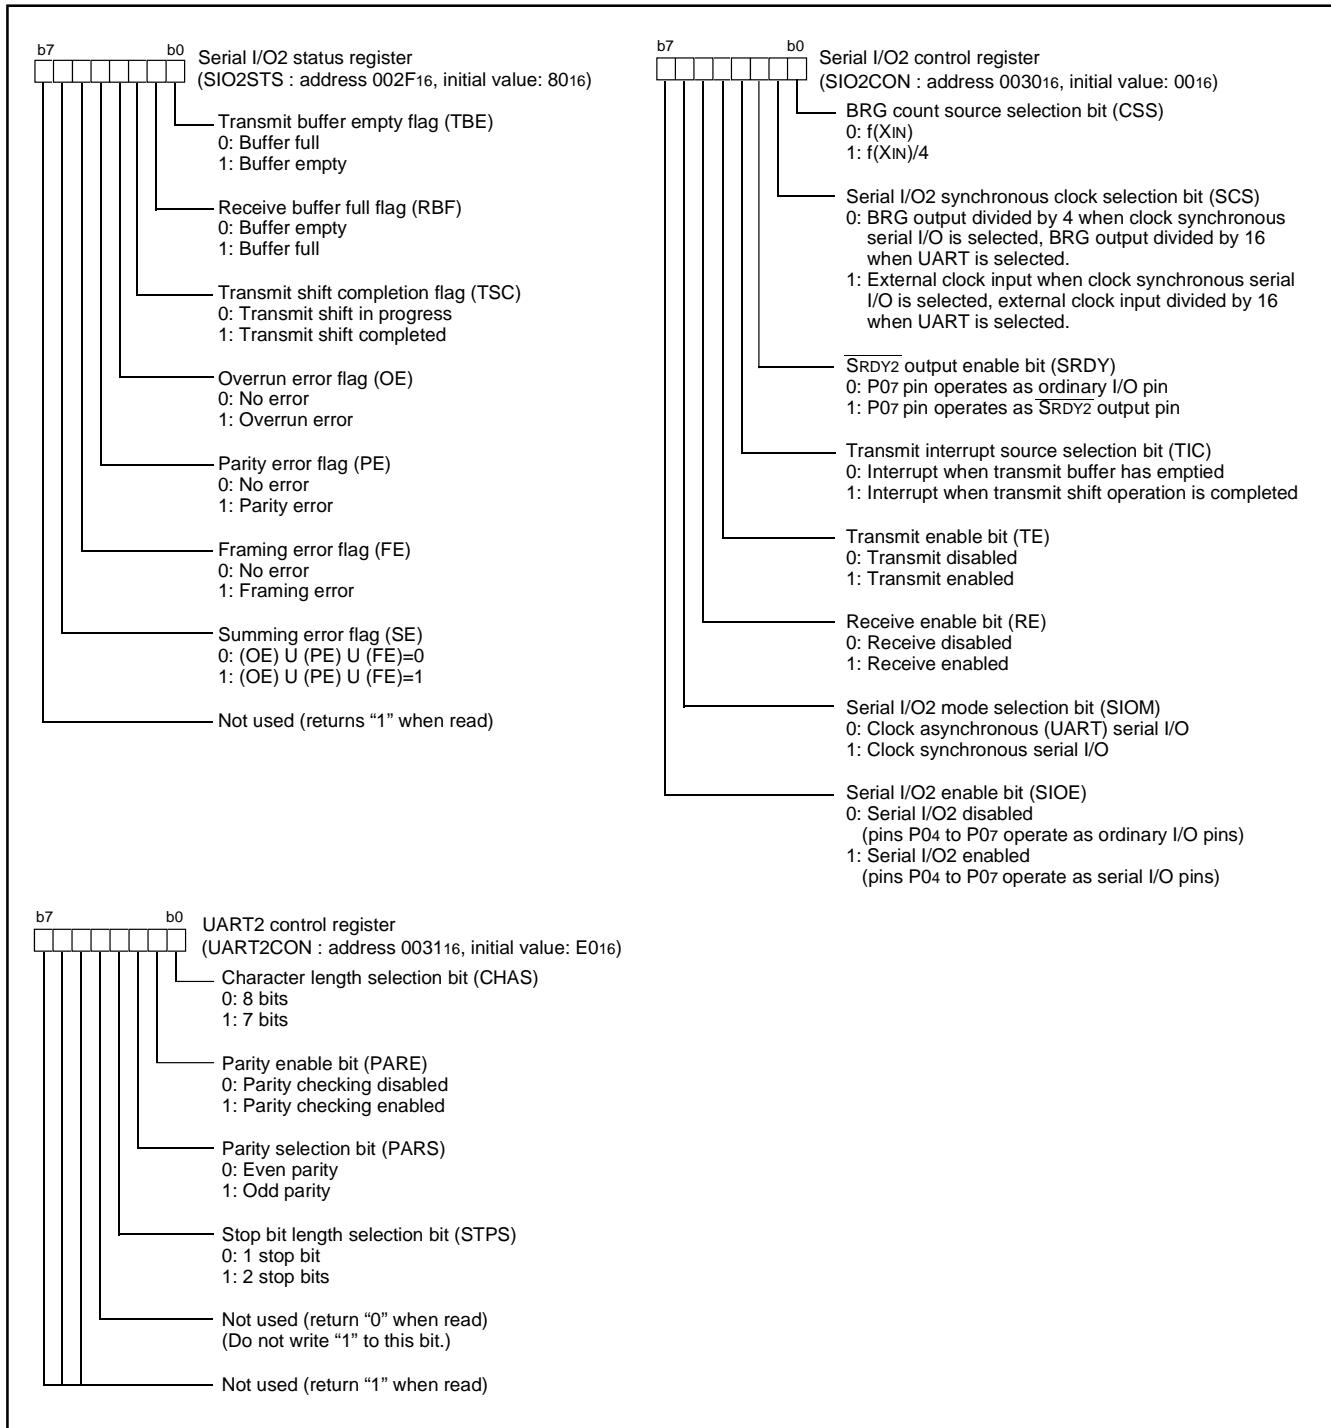

Fig. 61 Structure of serial I/O2-related registers

## A/D Converter

The functional blocks of the A/D converter are described below.

### [A/D conversion register] AD

The A/D conversion register is a read-only register that stores the result of A/D conversion. Do not read out this register during an A/D conversion.

## [A/D control register] ADCON

The A/D control register controls the A/D converter.

Bit 2 to 0 are analog input pin selection bits.

Bit 3 is the A/D conversion clock selection bit. When "0" is set to this bit, the A/D conversion clock is  $f(XIN)/2$  and the A/D conversion time is 122 cycles of  $f(XIN)$ . When "1" is set to this bit, the A/D conversion clock is  $f(XIN)$  and the A/D conversion time is 61 cycles of  $f(XIN)$ .

Bit 4 is the A/D conversion completion bit. The value of this bit remains at "0" during A/D conversion, and changes to "1" at completion of A/D conversion.

A/D conversion is started by setting this bit to “0”.

### [Comparison voltage generator]

The comparison voltage generator divides the voltage between AVss and VREF by 1024, and outputs the divided voltages.

### [Channel selector]

The channel selector selects one of ports P25/AN5 to P20/AN0, and inputs the voltage to the comparator.

### [Comparator and control circuit]

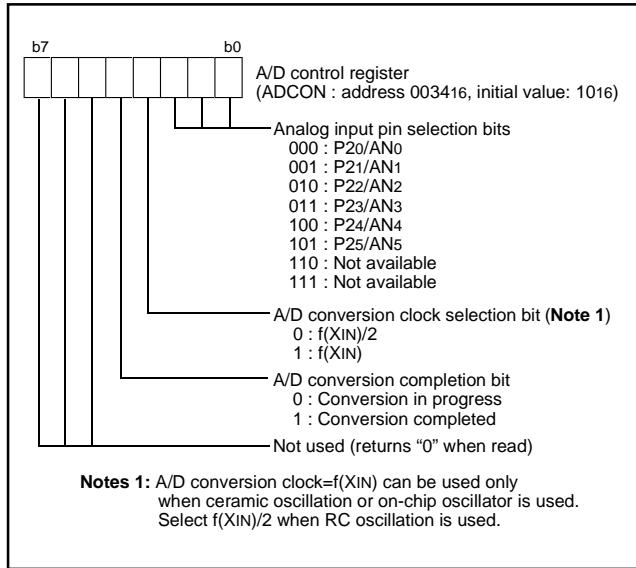

The comparator and control circuit compares an analog input voltage with the comparison voltage and stores its result into the A/D conversion register. When A/D conversion is completed, the control circuit sets the A/D conversion completion bit and the A/D interrupt request bit to "1". Because the comparator is constructed linked to a capacitor, set  $f(XIN)$  in order that the A/D conversion clock is 250 kHz or over during A/D conversion.

## ■ Notes on A/D converter

As for AD translation accuracy, on the following operating conditions, accuracy may become low.

(1) Since the analog circuit inside a microcomputer becomes sensitive to noise when V<sub>REF</sub> voltage is set up lower than V<sub>CC</sub> voltage, accuracy may become low rather than the case where V<sub>REF</sub> voltage and V<sub>CC</sub> voltage are set up to the same value..

(2) When V<sub>REF</sub> voltage is lower than [ 3.0 V ], the accuracy at the low temperature may become extremely low compared with that at room temperature. When the system would be used at low temperature, the use at V<sub>REF</sub>=3.0 V or more is recommended

**Fig. 62 Structure of A/D control register**

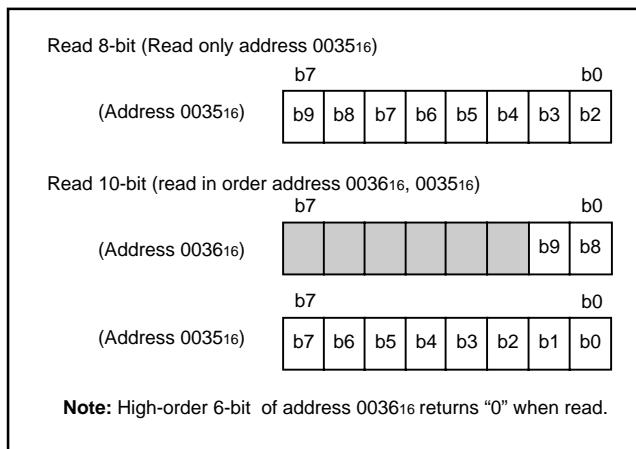

Fig. 63 Structure of A/D conversion register

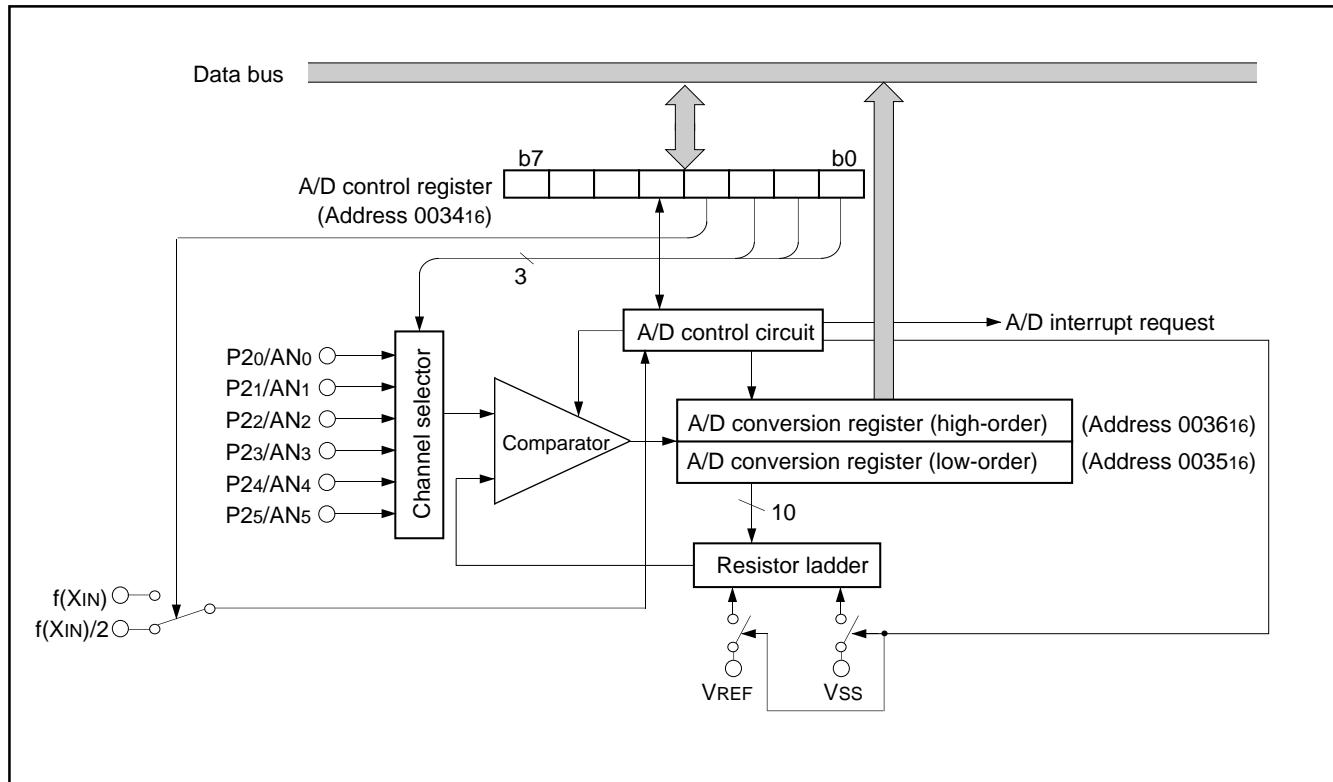

Fig. 64 Block diagram of A/D converter

## Watchdog Timer

The watchdog timer gives a means for returning to a reset status when the program fails to run on its normal loop due to a runaway. The watchdog timer consists of an 8-bit watchdog timer H and an 8-bit watchdog timer L, being a 16-bit counter.

### ● Standard operation of watchdog timer

#### (1) Start of watchdog timer

The watchdog timer starts operating by setting value of the function set ROM data 2 (FSROM2: address 0FFA16) or writing to the watchdog timer control register (WDTCON: address 003916). Set "0" to the watchdog timer start selection bit (bit 1 of FSROM2) when operation starts by setting value of FSROM2. In this case, the watchdog timer starts operating after releasing reset.

Write an arbitrary value to WDTCON when FSROM2 is set to be invalid and operation starts by program. Operation by program can start even when "1" (stop state after releasing reset) is set to the watchdog timer start selection bit.

#### (2) Operation of watchdog timer

Watchdog timer L is set to "FF16" and watchdog timer H is set to "FF16" by reset or writing an arbitrary value to WDTCON.

When the watchdog timer starts operating, the selected clock is counted and internal reset occurs by the watchdog timer H underflow.

Accordingly, write to WDTCON before underflow by program.

When WDTCON is read, the values of the STP instruction function selection bit, watchdog timer H count source selection bit and the high-order 6 bits of the watchdog timer H are read.

#### (3) Count source clock of watchdog timer

The count source clock of the watchdog timer can be selected by the watchdog timer source clock selection bit (bit 0 of FSROM2).

If "0" is set to the watchdog timer source clock selection bit, the count source clock of the watchdog timer always is the on-chip oscillator output/16.

It changes by setting the clock division ratio selection bits (bit 7 and bit 6 of the CPU mode register) when "1" is set to the watchdog timer source clock selection bit or FSROM2 is set to be invalid.

When a double-speed mode, a high-speed mode, and a middle-speed mode are selected by the clock division ratio selection bits, the count source clock of the watchdog timer becomes  $f(XIN)/16$ .

When the supply from on-chip oscillator is selected, it becomes the on-chip oscillator output/16.

#### (4) Watchdog timer H count source selection bit

The count source of watchdog timer H can be selected by FSROM2 or program.

When "0" is set to watchdog timer H count source selection bit (bit 2 of FSROM2), the watchdog timer L underflow signal is selected as the count source of watchdog timer H and the detection time is 131.072 ms at  $f(XIN) = 8$  MHz.

When "1" is set to this bit, the clock selected as the count source of watchdog timer L is input to watchdog timer H. In this case, the detection time is 512  $\mu$ s at  $f(XIN) = 8$  MHz.

When FSROM2 is set to be invalid, the count source of watchdog timer can be set by watchdog timer H count source selection bit (bit 7 of WDTCON).

When "0" is set to this bit, the watchdog timer L underflow signal is selected as the count source of watchdog timer H.

When "1" is set to this bit, the clock selected as the count source of watchdog timer L is input to watchdog timer H.

This bit is cleared to "0" after reset.

#### (5) STP instruction function selection bit

The function of the STP instruction can be selected by FSROM2 or program.

When "0" is set to the STP instruction function selection bit (bit 3 of FSROM2), system enters into the stop mode at the STP instruction execution.

When "1" is set to this bit, internal reset occurs at the STP instruction execution. When the function of the STP instruction is set by FSROM2, it cannot be changed by program.

When setting value of FSROM2 is invalid, the function of the STP instruction can be set by the STP instruction function selection bit (bit 6 of WDTCON).

When "0" is set to this bit, system enters into the stop mode at the STP instruction execution.

When "1" is set to this bit, internal reset occurs at the STP instruction execution.

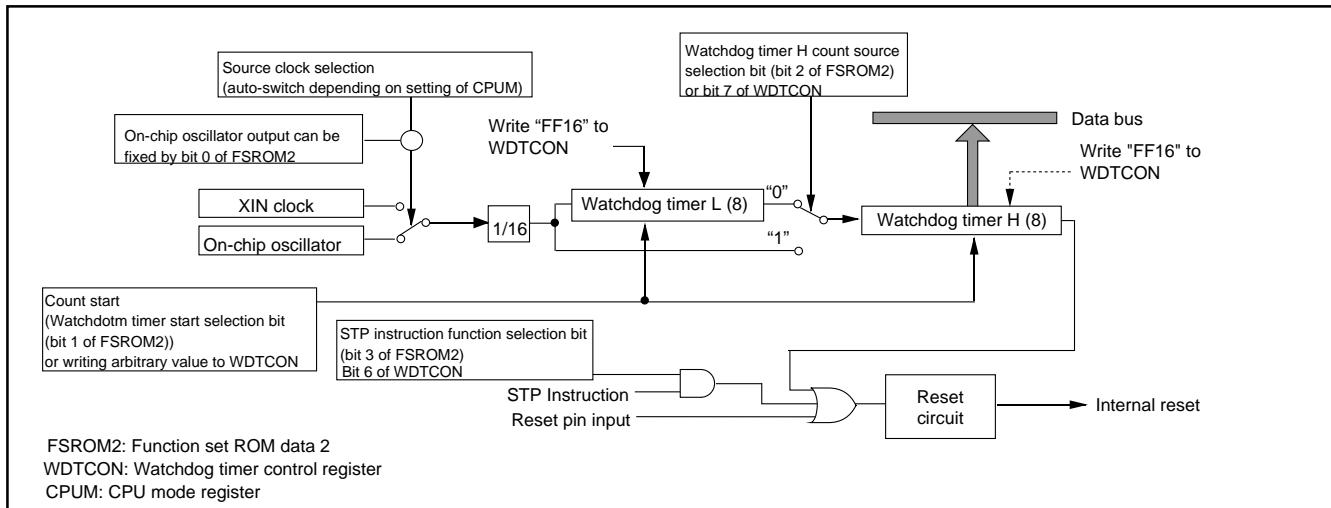

Once this bit is set to "1", it cannot be changed to "0" by program. This bit is cleared to "0" after reset.

### ■ Notes on watchdog timer

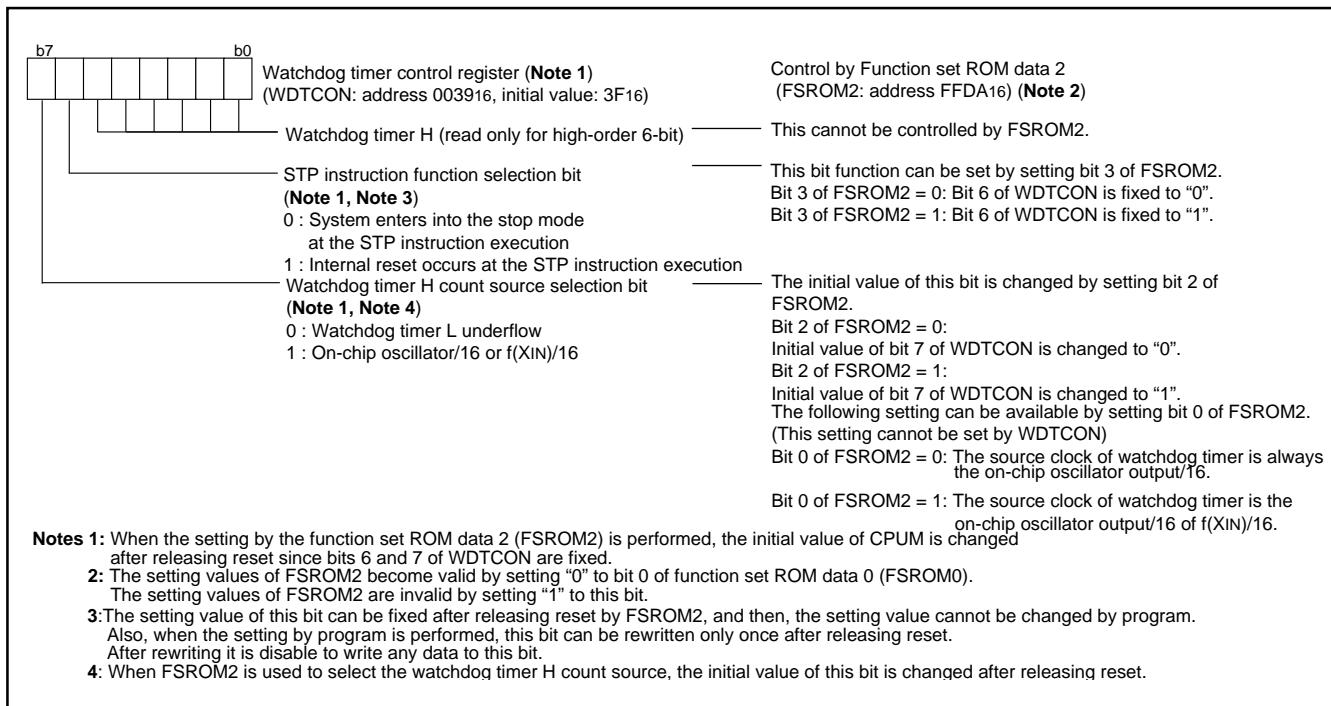

1. The watchdog timer is operating during the wait mode. Write data to the watchdog timer control register to prevent timer underflow.

2. The watchdog timer stops during the stop mode. However, the watchdog timer is running during the oscillation stabilizing time after the STP instruction is released. In order to avoid the underflow of the watchdog timer, the watchdog timer count source selection bit (bit 7 of watchdog timer control register (address 3916)) before executing the STP instruction.

3. The STP instruction function selection bit (bit 6 of watchdog timer control register (address 3916)) can be rewritten only once after releasing reset. After rewriting it is disable to write any data to this bit.

**Fig. 65 Block diagram of watchdog timer**

**Fig. 66 Structure of watchdog timer control register**

## Power-on Reset Circuit

Reset can be automatically performed at power on (power-on reset) by the built-in power-on reset circuit.

In order to use the power-on reset circuit effectively, the time for the supply voltage to rise from 0 V to 1.8 V must be set to 1 ms or less.

When the built-in power-on reset circuit is used, pull-up the RESET pin to Vcc.

## Low Voltage Detection Circuit

The built-in low voltage detection circuit is designed to detect a drop in voltage and to reset the microcomputer if the power source voltage drops below a set value (Typ.1.90 V).

The low voltage detection circuit is valid by setting "1" to bit 1 of the function set ROM data 0.

Also, when "1" is set to bit 3 of the function set ROM data 0, the low voltage detection circuit can be valid even in the stop mode.

The low voltage detection circuit is stopped in the stop mode by setting "0" to this bit, so that the power dissipation is reduced.

**Notes 1:** X : Undefined

**2:** The content of other registers is undefined when the microcomputer is reset.

The initial values must be surely set before you use it.

**3:** When the setting by the function set ROM data 2 (FSROM2) is performed, the initial values of these registers at reset are changed.

Fig. 69 Internal status of microcomputer at reset

## Clock Generating Circuit

An oscillation circuit can be formed by connecting a resonator between XIN and XOUT, and an RC oscillation circuit can be formed by connecting a resistor and a capacitor.

Use the circuit constants in accordance with the resonator manufacturer's recommended values.

No external resistor is needed between XIN and XOUT since a feed-back resistor exists on-chip. (An external feed-back resistor may be needed depending on conditions.)

### (1) On-chip oscillator operation

When the MCU operates by the on-chip oscillator for the main clock, connect XIN pin to Vcc through a resistor and leave XOUT pin open.

The clock frequency of the on-chip oscillator depends on the supply voltage and the operation temperature range.

Be careful that variable frequencies when designing application products.

### (2) Ceramic resonator

When the ceramic resonator is used for the main clock, connect the ceramic resonator and the external circuit to pins XIN and XOUT at the shortest distance. A feedback resistor is built in between pins XIN and XOUT.

### (3) RC oscillation

When the RC oscillation is used for the main clock, connect the XIN pin and XOUT pin to the external circuit of resistor R and the capacitor C at the shortest distance.

The frequency is affected by a capacitor, a resistor and a micro-computer.

So, set the constants within the range of the frequency limits.

### (4) External clock

When the external signal clock is used for the main clock, connect the XIN pin to the clock source and leave XOUT pin open.

Select "0" (ceramic oscillation) to oscillation mode selection bit of CPU mode register (003B16).

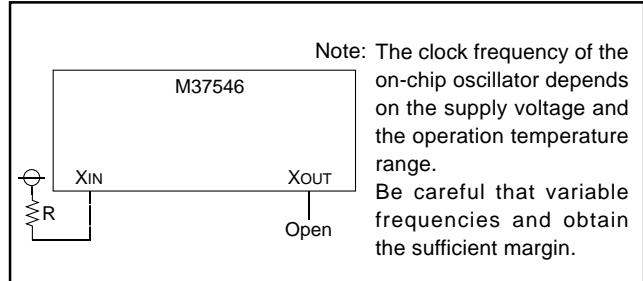

Fig. 70 Processing of XIN and XOUT pins at on-chip oscillator operation

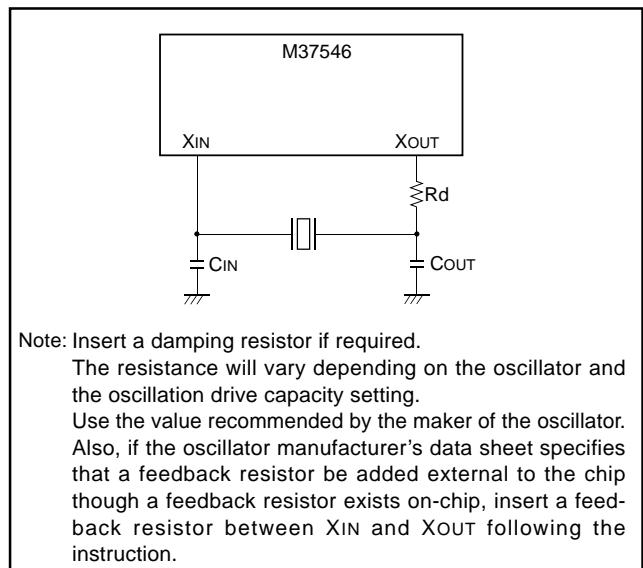

Fig. 71 External circuit of ceramic resonator

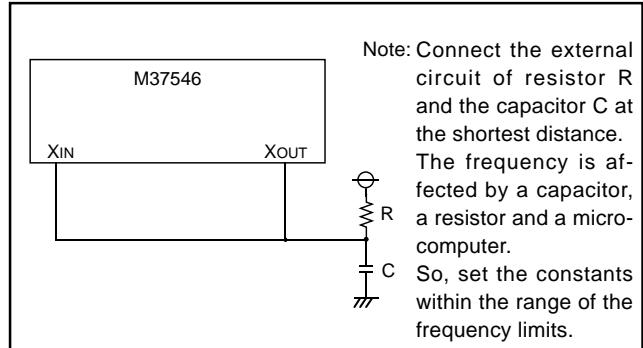

Fig. 72 External circuit of RC oscillation

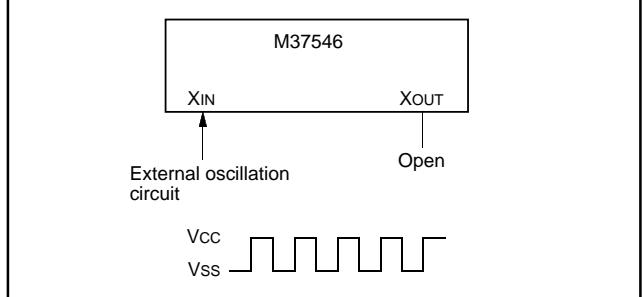

Fig. 73 External clock input circuit

### (1) Oscillation control

#### • Stop mode

When the STP instruction is executed, the internal clock  $\phi$  stops at an "H" level and the XIN oscillator stops. At this time, timer 1 is set to "0116" and prescaler 1 is set to "FF16" when the oscillation stabilization time set bit after release of the STP instruction is "0". On the other hand, timer 1 and prescaler 1 are not set when the above bit is "1". Accordingly, set the wait time fit for the oscillation stabilization time of the oscillator to be used.  $f(XIN)/16$  is forcibly connected to the input of prescaler 1. When an external interrupt is accepted, oscillation is restarted but the internal clock  $\phi$  remains at "H" until timer 1 underflows. As soon as timer 1 underflows, the internal clock  $\phi$  is supplied. This is because when a ceramic oscillator is used, some time is required until a start of oscillation. In case oscillation is restarted by reset, no wait time is generated. So apply an "L" level to the RESET pin while oscillation becomes stable, or set the wait time by on-chip oscillator operation after system is released from reset until the oscillation is stabled.

#### • Wait mode

If the WIT instruction is executed, the internal clock  $\phi$  stops at an "H" level, but the oscillator does not stop. The internal clock restarts if a reset occurs or when an interrupt is received. Since the oscillator does not stop, normal operation can be started immediately after the clock is restarted. To ensure that interrupts will be received to release the STP or WIT state, interrupt enable bits must be set to "1" before the STP or WIT instruction is executed.

## ■ Notes on Clock Generating Circuit

For use with the oscillation stabilization set bit after release of the STP instruction set to "1", set values in timer 1 and prescaler 1 after fully appreciating the oscillation stabilization time of the oscillator to be used.

#### • Switch of ceramic and RC oscillations

After releasing reset the operation starts by starting an on-chip oscillator. Then, a ceramic oscillation or an RC oscillation is selected by setting bit 5 of the CPU mode register.

#### • Double-speed mode

When a ceramic oscillation is selected, a double-speed mode can be used. Do not use it when an RC oscillation is selected.

#### • CPU mode register

Bits 5, 1 and 0 of CPU mode register are used to select oscillation mode and to control operation modes of the microcomputer. In order to prevent the dead-lock by error-writing (ex. program run-away), these bits can be rewritten only once after releasing reset. After rewriting it is disable to write any data to the bit. (The emulator MCU "M37542RSS" is excluded.)

Also, when the read-modify-write instructions (SEB, CLB) are executed to bits 2 to 4, 6 and 7, bits 5, 1 and 0 are locked.

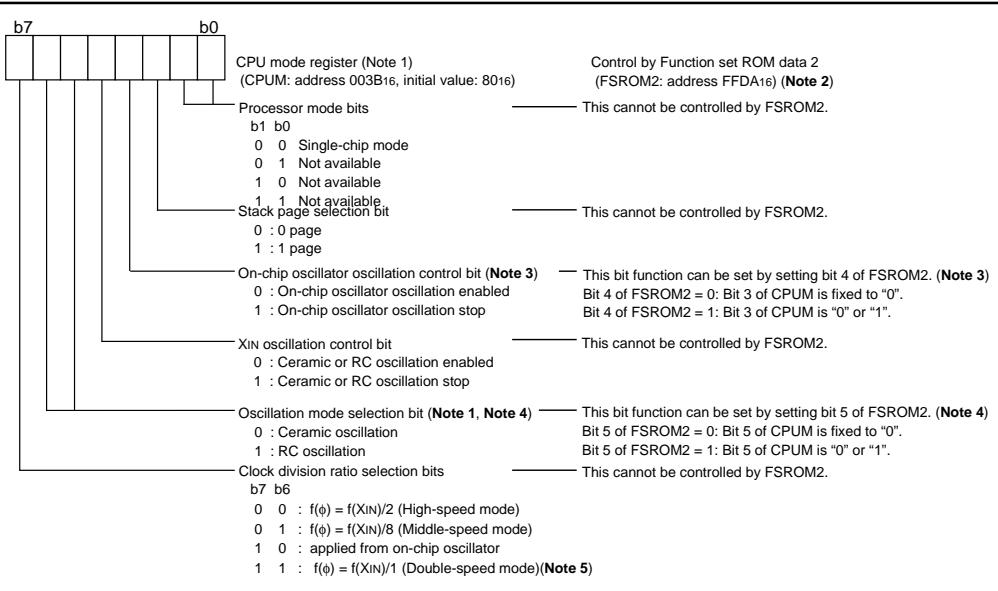

Fig. 74 Structure of CPU mode register

- Clock division ratio, XIN oscillation control, on-chip oscillator control

The state transition shown in Fig. 78 can be performed by setting the clock division ratio selection bits (bits 7 and 6), XIN oscillation control bit (bit 4), on-chip oscillator oscillation control bit (bit 3) of CPU mode register. Be careful of notes on use in Fig. 78.

- Count source (Timer 1, Timer A, Timer B, Timer X, Serial I/O, Serial I/O2, A/D converter, Watchdog timer)

The count sources of these functions are affected by the clock division selection bit of the CPU mode register.

The  $f(XIN)$  clock is supplied to the watchdog timer when selecting  $f(XIN)$  as the CPU clock.

The on-chip oscillator output is supplied to these functions when selecting the on-chip oscillator output as the CPU clock.

However, the watchdog timer is also affected by the function set ROM.

## ● On-chip oscillation division ratio

At on-chip oscillator mode, division ratio of on-chip oscillator for CPU clock is selected by setting value of on-chip oscillation division ratio selection register. The division ratio of on-chip oscillation for CPU clock is selected from among 1/1, 1/2, 1/8, 1/128. The operation clock for the peripheral function block is not changed by setting value of this register.

### ■ Notes on On-chip Oscillation Division Ratio

- When system is released from reset, Rosc/8 (on-chip oscillator middle-speed mode) is selected for CPU clock.
- When state transition from the ceramic or RC oscillation to on-chip oscillator, Rosc/8 (on-chip oscillator middle-speed mode) is selected for CPU clock.
- When the MCU operates by on-chip oscillator for the main clock without external oscillation circuit, connect XIN pin to Vcc through a resistor and leave XOUT pin open.

Set "10010x002" (x = 0 or 1) to CPUM.

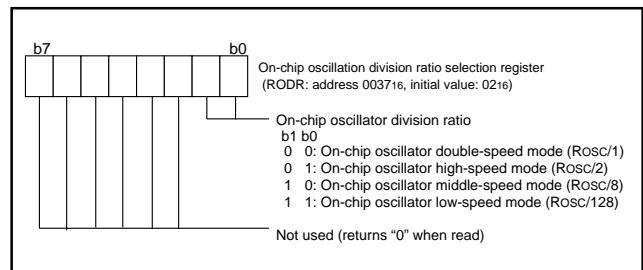

Fig. 75 Structure of on-chip oscillation division ratio selection register

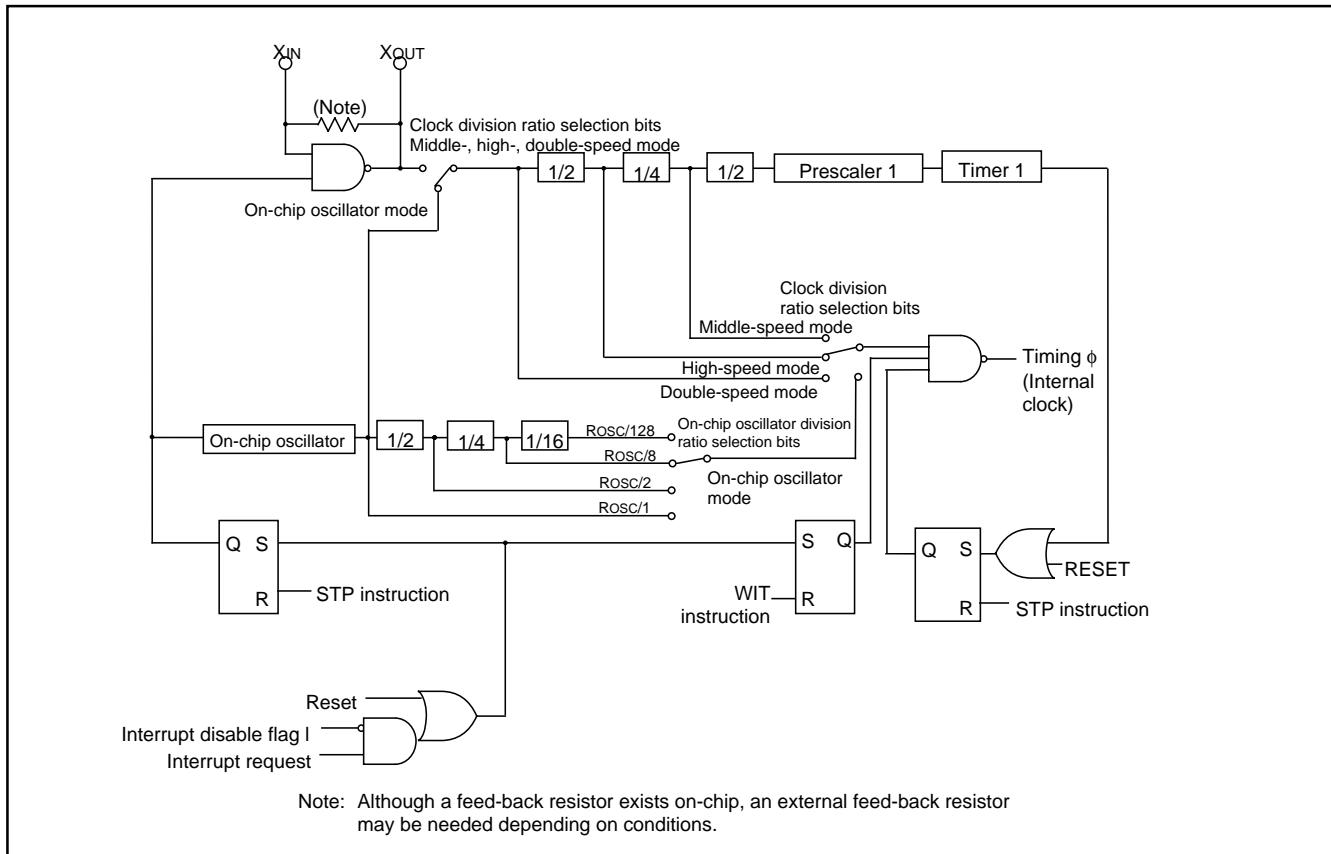

Fig. 76 Block diagram of internal clock generating circuit (for ceramic resonator)

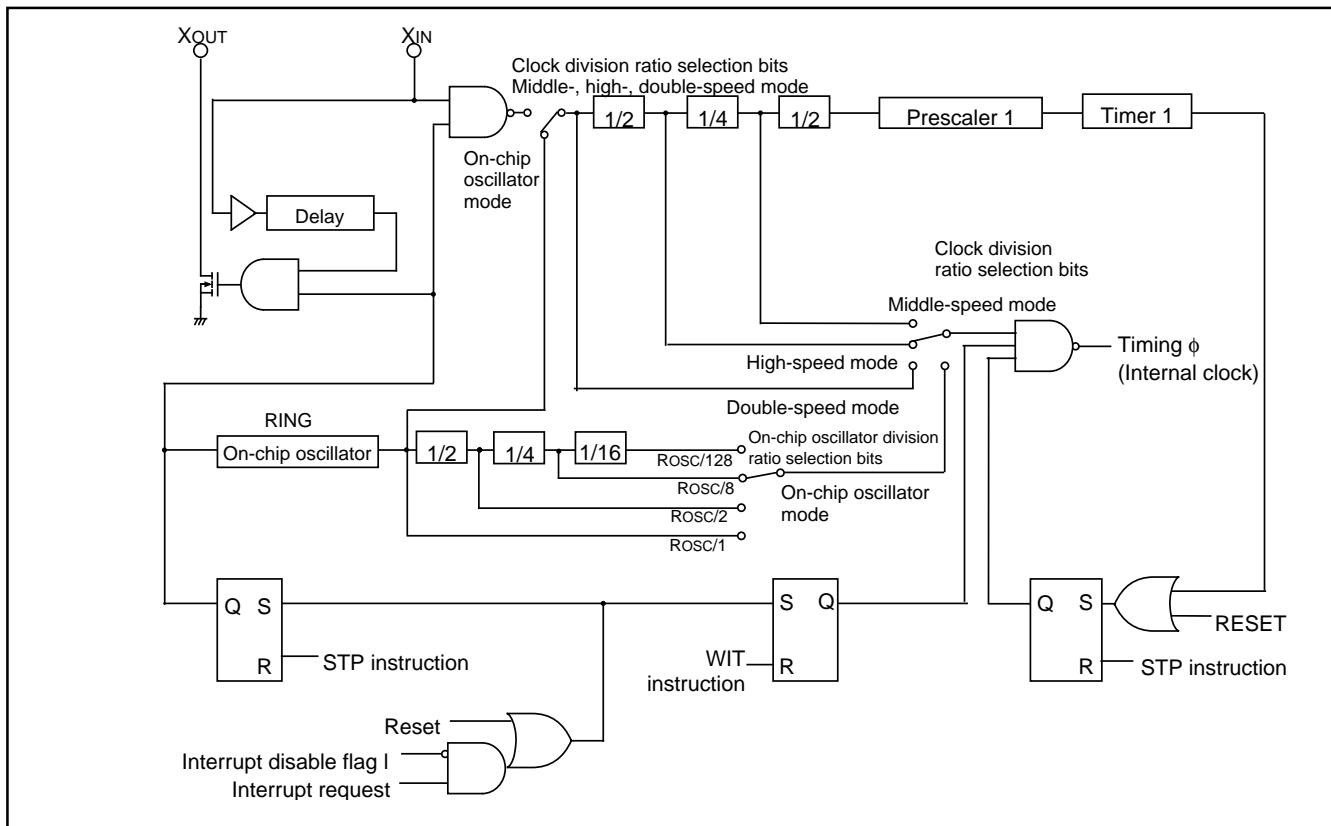

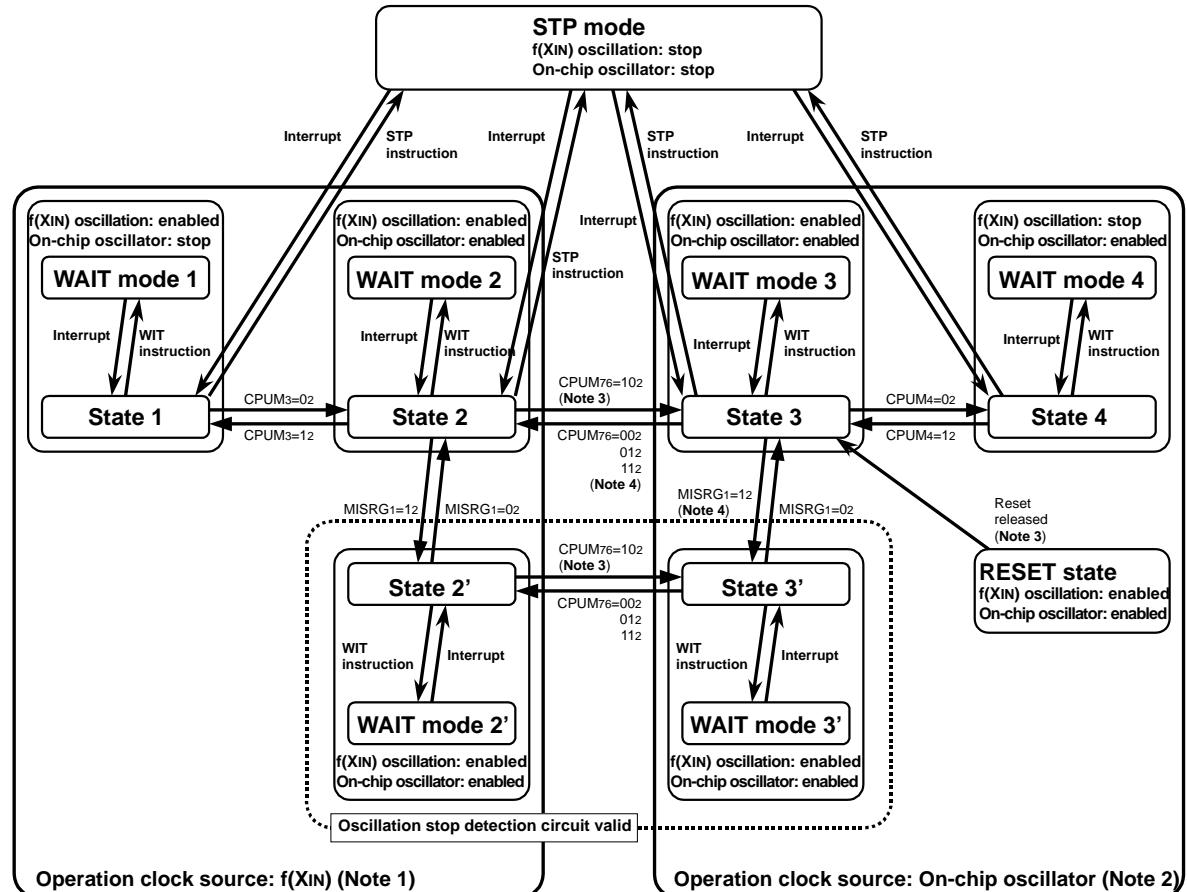

Fig. 77 Block diagram of internal clock generating circuit (for RC oscillation)

#### Notes on switch of clock

- (1) In operation clock =  $f(XIN)$ , the following can be selected for the CPU clock division ratio.
  - $f(XIN)/2$  (high-speed mode)
  - $f(XIN)/8$  (middle-speed mode)
  - $f(XIN)$  (double-speed mode, only at a ceramic oscillation)
- (2) In operation clock = On-chip oscillator, the following can be selected for the CPU clock division ratio.
  - ROSC/1 (On-chip oscillator double-speed mode)
  - ROSC/2 (On-chip oscillator high-speed mode)
  - ROSC/8 (On-chip oscillator middle-speed mode)
  - ROSC/128 (On-chip oscillator low-speed mode)
- (3) After system is released from reset, and state transition of state 2 → state 3 and state transition of state 2' → state 3' is selected for CPU clock.
- (4) Executing the state transition state 3 to 2 or state 3' to 2' after stabilizing XIN oscillation.
- (5) When the state 2 → state 3 → state 4 is performed, execute the NOP instruction as shown below according to the division ratio of CPU clock.
  1. CPUM76 = 102 (state 2 → state 3)
  2. NOP instruction
    - Transition from Double-speed mode: NOP X 3
    - Transition from High-speed mode: NOP X 1
    - Transition from Middle-speed mode: NOP X 0
  3. CPU4 = 12 (state 3 → state 4)
- (6) When the state 3 → state 2 → state 1 is performed, execute the NOP instruction as shown below according to the division ratio of CPU clock.
  1. CPUM76 = 002 or 012 or 112 (state 3 → state 2)
  2. NOP instruction
    - Transition from On-chip oscillator double-speed mode: NOP X 4
    - Transition from On-chip oscillator high-speed mode: NOP X 2
    - Transition from On-chip oscillator middle-speed mode: NOP X 0
    - Transition from On-chip oscillator low-speed mode: NOP X 0
  3. CPUM3 = 12 (state 2 → state 1)

Fig. 78 State transition

## ● Oscillation stop detection circuit

The oscillation stop detection circuit is used for reset occurrence when a ceramic resonator or RC oscillation circuit stops by disconnection. To use this circuit, set an on-chip oscillator to be in active.

The oscillation stop detection circuit is in active to set "1" to the ceramic or RC oscillation stop detection function active bit. When the oscillation stop detection circuit is in active, ceramic or RC oscillation is watched by the on-chip oscillator. When stop of ceramic or RC oscillation is detected, the oscillation stop detection status bit is set to "1". While "1" is set to the oscillation stop reset bit, internal reset occurs when oscillation stop is detected.

The external reset and the oscillation stop reset can be discriminated by reading the oscillation stop detection status bit. The oscillation stop detection status bit retains "1", not initialized, when the oscillation stop reset occurs. The oscillation stop detection status bit is initialized to "0" when the external reset occurs. Accordingly, reset by oscillation stop can be confirmed by using this flag.

### ■ Notes on Oscillation Stop Detection Circuit

- Do not execute the transition to "state 2'a" shown in Figure 80 because in this "state 2'a", MCU is stopped without reset even when XIN oscillation is stopped.
- Ceramic or RC oscillation stop detection function active bit is not cleared by the oscillation stop internal reset. Accordingly, the oscillation stop detection circuit is in active when system is released from internal reset cause of oscillation stop detection.
- Oscillation stop detection status bit is initialized by the following operation.
  - (1) External reset
  - (2) Write "0" data to the ceramic or RC oscillation stop detection function active bit.
- The oscillation stop detection circuit is not included in the emulator MCU "M37542RSS".

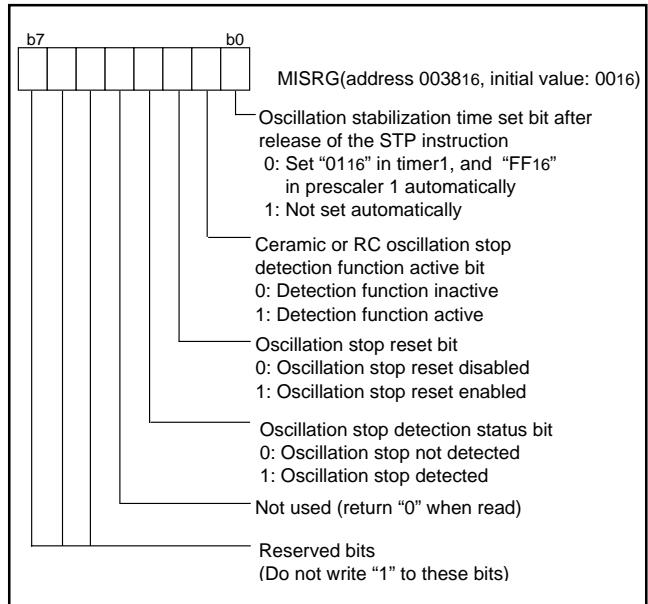

Fig. 79 Structure of MISRG

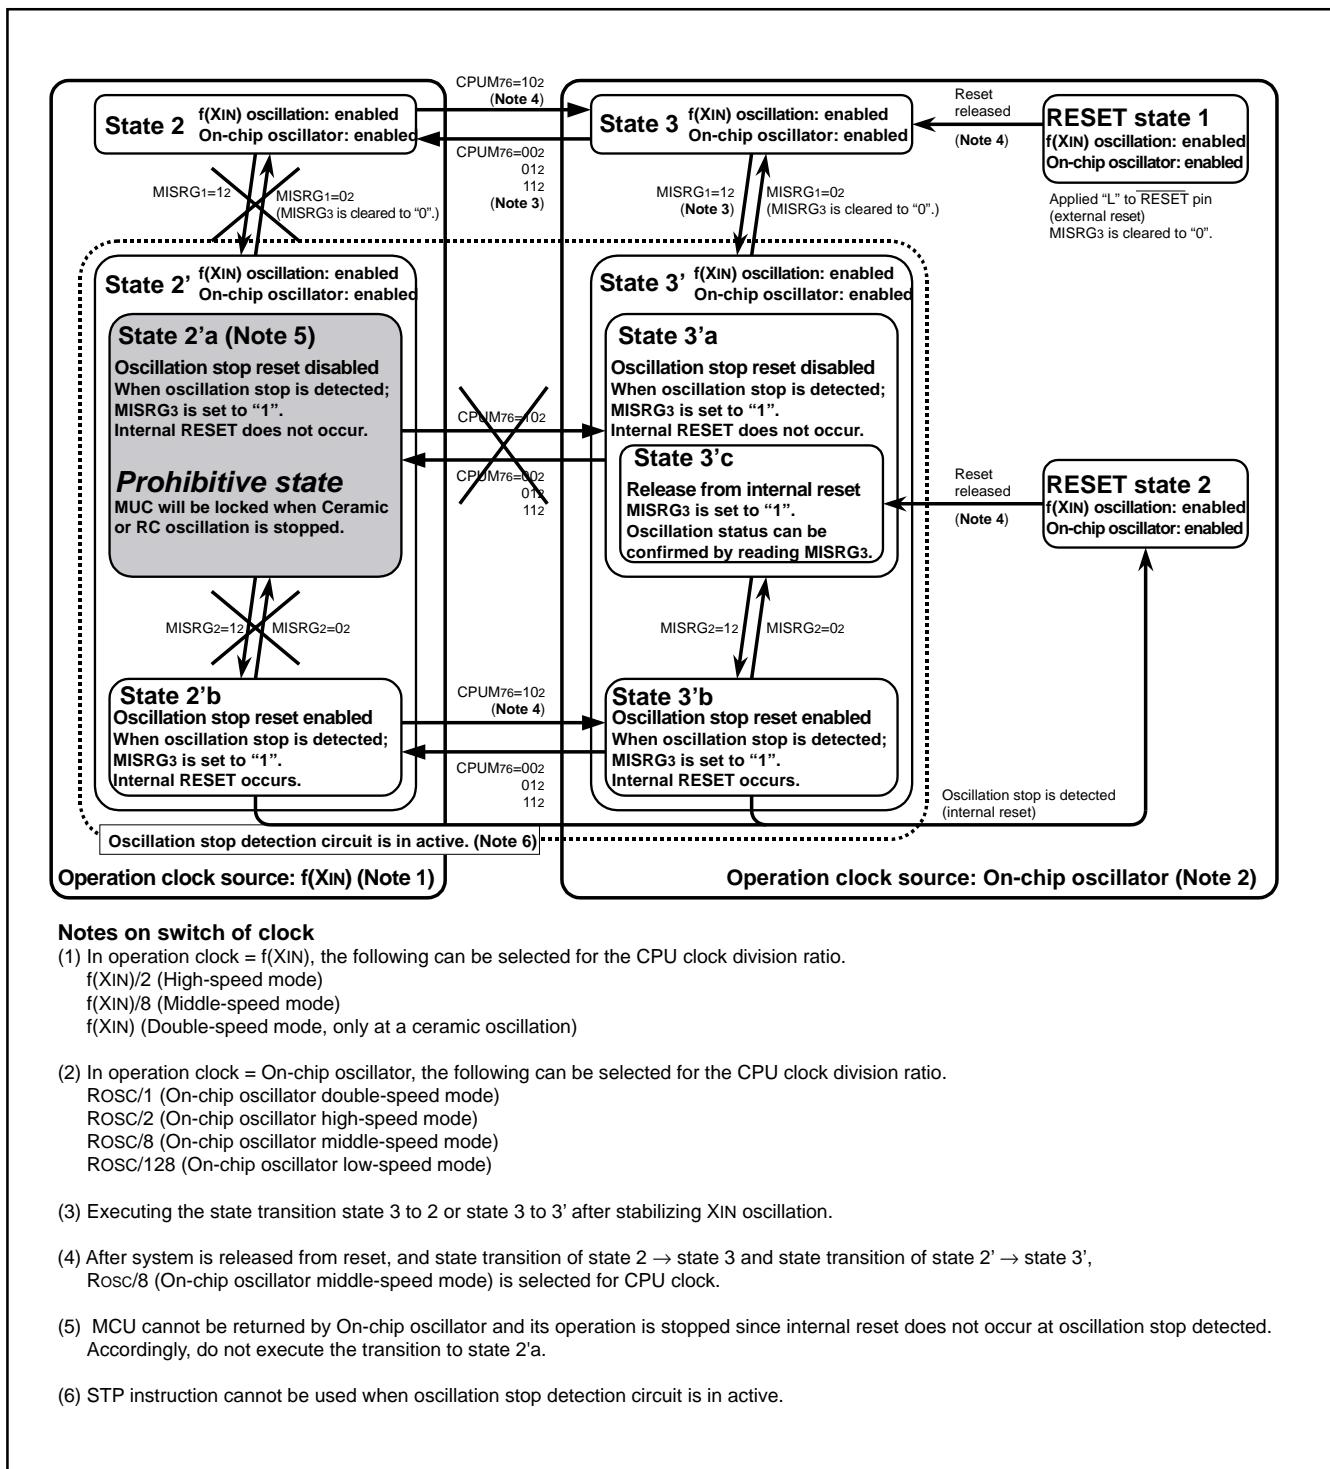

Fig. 80 State transition 2

## ● Function set ROM

Figure 82 shows the Assignment of Function set ROM area. The random data are written to the Renesas shipment test areas (addresses FFD416 to address FFD716). Do not rewrite the data of these areas. When the checksum is included in the user program, avoid assigning it to these areas. The function set ROM data 0 to 2 (addresses FFD816 to FFDA16) are used to set the peripheral function. Data set to these areas become valid after releasing reset. The ROM code protect to disable the reading of the built-in QzROM area is assigned to address FFDB16.

### [Function set ROM data] FSROM0, FSROM1, FSROM2

Function set ROM data 0 to 2 (addresses FFD816 to FFDA16) are used to set modes of peripheral functions. By setting values to these areas, the operation mode of each peripheral function are set after releasing reset. Refer to the descriptions of peripheral functions for the details of operation of peripheral functions.

- CPU mode register
- Watchdog timer
- Low voltage detection circuit

When "1" is set to bit 0 of function set ROM data 0 (address FFD816), the written values to bit 5 to bit 0 of function set ROM data 2 (address FFDA16) can become invalid. When the values of bit 5 to bit 0 of function set ROM data 2 (address FFDA16) are invalid, the operation mode of the peripheral functions can be set by setting the related registers.

### [ROM code protect]

By setting "0016" to ROM code protect (address FFDB16), reading of the built-in QzROM by the serial programmer is disabled.

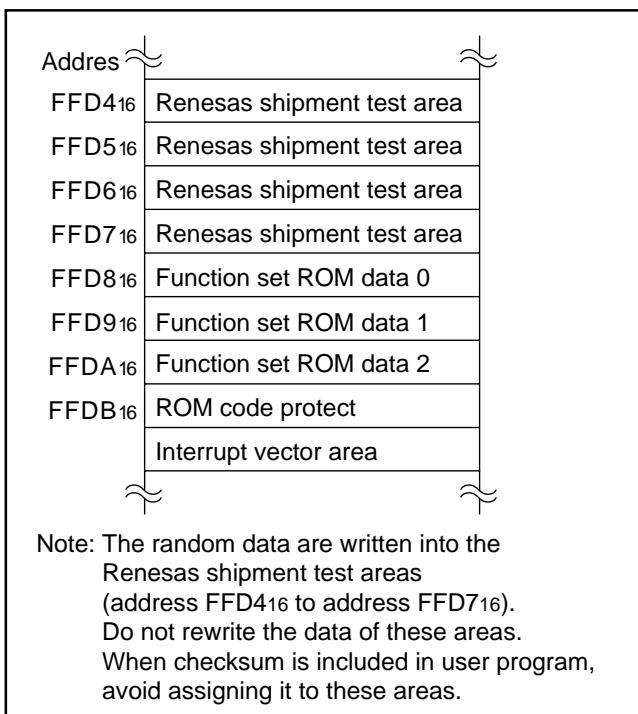

Fig. 82 Assignment of Function set ROM area

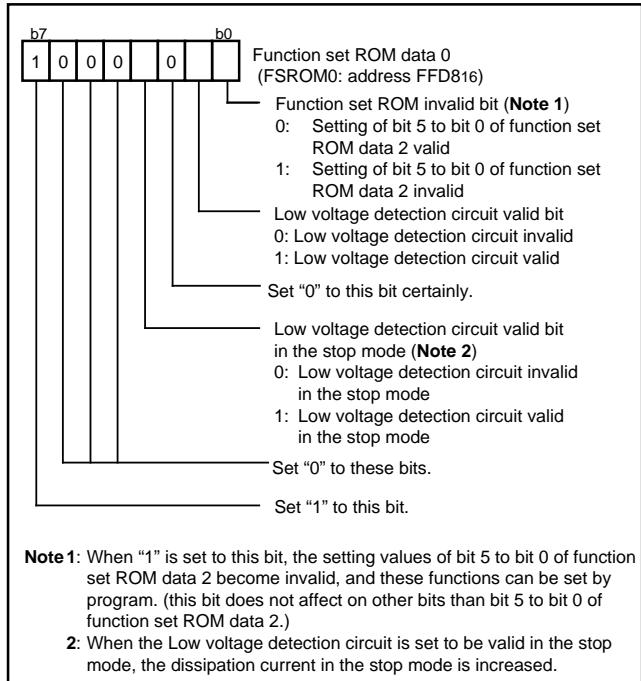

Fig. 83 Structure of Function set ROM data 0

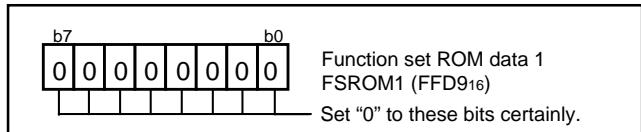

Fig. 84 Structure of Function set ROM data 1

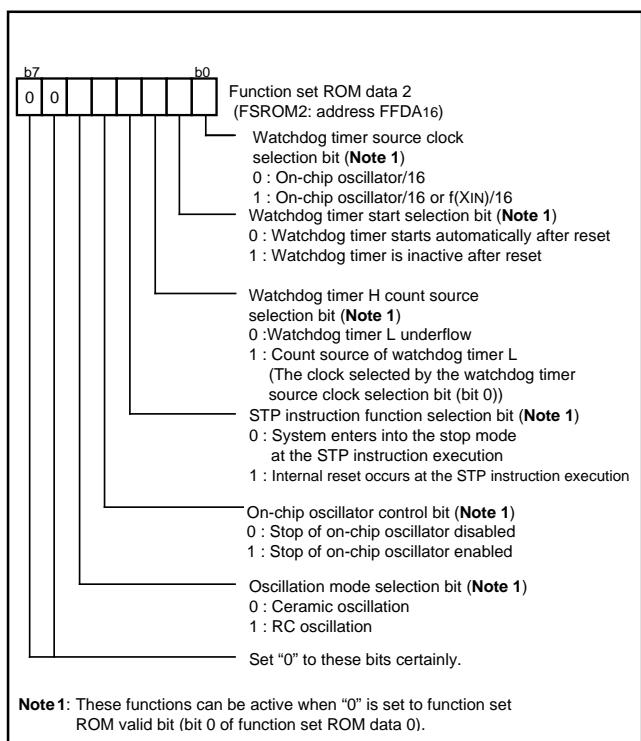

Fig. 85 Structure of Function set ROM data 2

## NOTES ON PROGRAMMING

### Processor Status Register

The contents of the processor status register (PS) after reset are undefined except for the interrupt disable flag I which is "1". After reset, initialize flags which affect program execution. In particular, it is essential to initialize the T flag and the D flag because of their effect on calculations.

### Interrupts

The contents of the interrupt request bit do not change even if the BBC or BBS instruction is executed immediately after they are changed by program because this instruction is executed for the previous contents. For executing the instruction for the changed contents, execute one instruction before executing the BBC or BBS instruction.

### Decimal Calculations

- For calculations in decimal notation, set the decimal mode flag D to "1", then execute the ADC instruction or SBC instruction. In this case, execute SEC instruction, CLC instruction or CLD instruction after executing one instruction before the ADC instruction or SBC instruction.
- In the decimal mode, the values of the N (negative), V (overflow) and Z (zero) flags are invalid.

### Ports

• The values of the port direction registers cannot be read. That is, it is impossible to use the LDA instruction, memory operation instruction when the T flag is "1", addressing mode using direction register values as qualifiers, and bit test instructions such as BBC and BBS.

It is also impossible to use bit operation instructions such as CLB and SEB and read/modify/write instructions of direction registers for calculations such as ROR.

For setting direction registers, use the LDM instruction, STA instruction, etc.

### A/D Conversion

Do not execute the STP instruction during A/D conversion.

### Instruction Execution Timing

The instruction execution time can be obtained by multiplying the frequency of the internal clock  $\phi$  by the number of cycles mentioned in the machine-language instruction table.

The frequency of the internal clock  $\phi$  is the same as that of the XIN in double-speed mode, twice the XIN cycle in high-speed mode and 8 times the XIN cycle in middle-speed mode.

### CPU Mode Register

The oscillation mode selection bit and processor mode bits can be rewritten only once after releasing reset. However, after rewriting it is disable to write any value to the bit. (Emulator MCU is excluded.)

When a ceramic oscillation is selected, a double-speed mode of the clock division ratio selection bits can be used. Do not use it when an RC oscillation is selected.

### State transition

Do not stop the clock selected as the operation clock because of setting of CM3, 4.

## NOTES ON HARDWARE

### Handling of Power Source Pin

In order to avoid a latch-up occurrence, connect a capacitor suitable for high frequencies as bypass capacitor between power source pin (Vcc pin) and GND pin (Vss pin). Besides, connect the capacitor to as close as possible. For bypass capacitor which should not be located too far from the pins to be connected, a ceramic capacitor of 0.01  $\mu$ F to 0.1  $\mu$ F is recommended.

## NOTES ON USE

### Countermeasures against noise

#### 1. Shortest wiring length

##### (1) Package

Select the smallest possible package to make the total wiring length short.

##### <Reason>

The wiring length depends on a microcomputer package. Use of a small package, for example QFP and not DIP, makes the total wiring length short to reduce influence of noise.

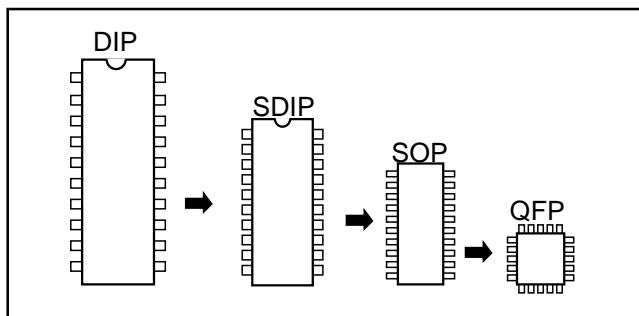

Fig. 84 Selection of packages

##### (2) Wiring for RESET pin

Make the length of wiring which is connected to the RESET pin as short as possible. Especially, connect a capacitor across the RESET pin and the Vss pin with the shortest possible wiring (within 20mm).

##### <Reason>

The width of a pulse input into the RESET pin is determined by the timing necessary conditions. If noise having a shorter pulse width than the standard is input to the RESET pin, the reset is released before the internal state of the microcomputer is completely initialized. This may cause a program runaway.

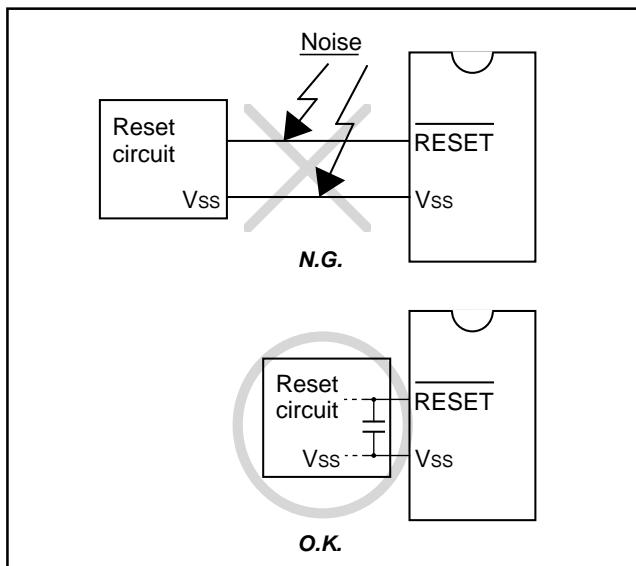

Fig. 85 Wiring for the RESET pin

#### (3) Wiring for clock input/output pins

- Make the length of wiring which is connected to clock I/O pins as short as possible.
- Make the length of wiring (within 20 mm) across the grounding lead of a capacitor which is connected to an oscillator and the Vss pin of a microcomputer as short as possible.
- Separate the Vss pattern only for oscillation from other Vss patterns.

##### <Reason>

If noise enters clock I/O pins, clock waveforms may be deformed. This may cause a program failure or program runaway. Also, if a potential difference is caused by the noise between the Vss level of a microcomputer and the Vss level of an oscillator, the correct clock will not be input in the microcomputer.

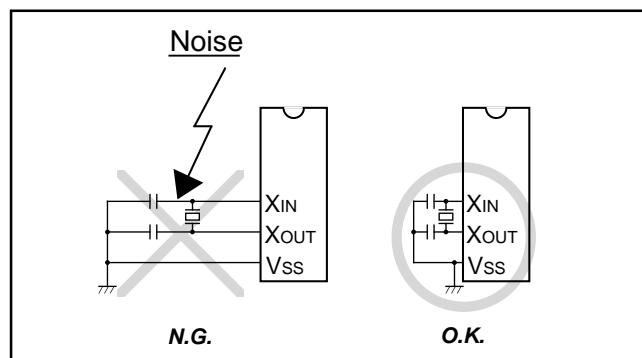

Fig. 86 Wiring for clock I/O pins

#### (4) Wiring to VPP pin

Connect VPP pin to a GND pattern at the shortest distance.

The GND pattern is required to be as close as possible to the GND supplied to Vss.

In order to improve the noise reduction, to connect a 5 kΩ resistor serially to the VPP pin - GND line may be valid.

As well as the above-mentioned, in this case, connect to a GND pattern at the shortest distance. The GND pattern is required to be as close as possible to the GND supplied to Vss.

##### <Reason>

The VPP pin of the QzROM is the power source input pin for the built-in QzROM. When programming in the built-in QzROM, the impedance of the VPP pin is low to allow the electric current for writing flow into the QzROM. Because of this, noise can enter easily. If noise enters the VPP pin, abnormal instruction codes or data are read from the built-in QzROM, which may cause a program runaway.

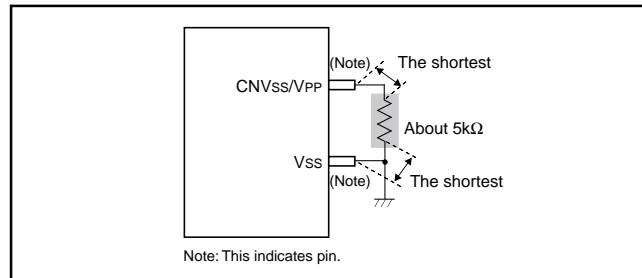

Fig. 87 Wiring for the VPP pin of the QzPROM

2. Connection of bypass capacitor across Vss line and Vcc line  
 Connect an approximately  $0.1 \mu\text{F}$  bypass capacitor across the Vss line and the Vcc line as follows:

- Connect a bypass capacitor across the Vss pin and the Vcc pin at equal length.
- Connect a bypass capacitor across the Vss pin and the Vcc pin with the shortest possible wiring.
- Use lines with a larger diameter than other signal lines for Vss line and Vcc line.
- Connect the power source wiring via a bypass capacitor to the Vss pin and the Vcc pin.

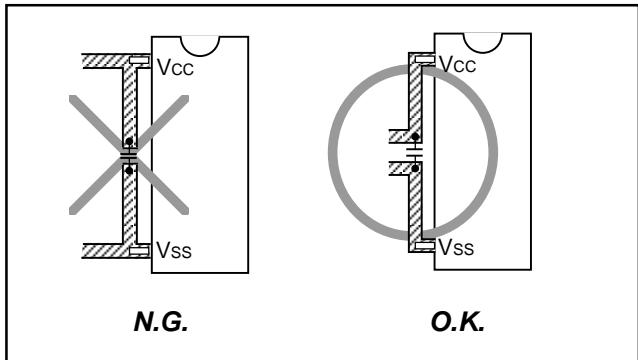

Fig. 88 Bypass capacitor across the Vss line and the Vcc line

### 3. Wiring to analog input pins

- Connect an approximately  $100 \Omega$  to  $1 \text{k}\Omega$  resistor to an analog signal line which is connected to an analog input pin in series. Besides, connect the resistor to the microcomputer as close as possible.
- Connect an approximately  $1000 \text{ pF}$  capacitor across the Vss pin and the analog input pin. Besides, connect the capacitor to the Vss pin as close as possible. Also, connect the capacitor across the analog input pin and the Vss pin at equal length.

#### <Reason>

Signals which is input in an analog input pin (such as an A/D converter/comparator input pin) are usually output signals from sensor. The sensor which detects a change of event is installed far from the printed circuit board with a microcomputer, the wiring to an analog input pin is longer necessarily. This long wiring functions as an antenna which feeds noise into the microcomputer, which causes noise to an analog input pin.

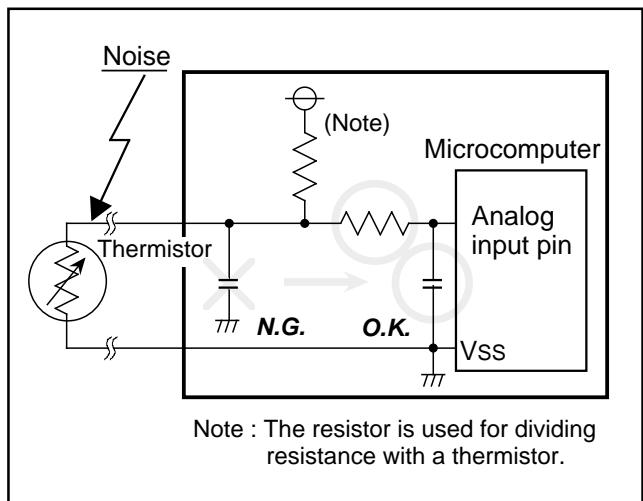

Fig. 89 Analog signal line and a resistor and a capacitor

- The analog input pin is connected to the capacitor of a voltage comparator. Accordingly, sufficient accuracy may not be obtained by the charge/discharge current at the time of A/D conversion when the analog signal source of high-impedance is connected to an analog input pin. In order to obtain the A/D conversion result stabilized more, please lower the impedance of an analog signal source, or add the smoothing capacitor to an analog input pin.

## 4. Oscillator concerns

Take care to prevent an oscillator that generates clocks for a microcomputer operation from being affected by other signals.

## (1) Keeping oscillator away from large current signal lines

Install a microcomputer (and especially an oscillator) as far as possible from signal lines where a current larger than the tolerance of current value flows.

## &lt;Reason&gt;

In the system using a microcomputer, there are signal lines for controlling motors, LEDs, and thermal heads or others. When a large current flows through those signal lines, strong noise occurs because of mutual inductance.

## (2) Installing oscillator away from signal lines where potential levels change frequently

Install an oscillator and a connecting pattern of an oscillator away from signal lines where potential levels change frequently. Also, do not cross such signal lines over the clock lines or the signal lines which are sensitive to noise.

## &lt;Reason&gt;

Signal lines where potential levels change frequently (such as the CNTR pin signal line) may affect other lines at signal rising edge or falling edge. If such lines cross over a clock line, clock waveforms may be deformed, which causes a microcomputer failure or a program runaway.

## (3) Oscillator protection using Vss pattern

As for a two-sided printed circuit board, print a Vss pattern on the underside (soldering side) of the position (on the component side) where an oscillator is mounted.

Connect the Vss pattern to the microcomputer Vss pin with the shortest possible wiring. Besides, separate this Vss pattern from other Vss patterns.

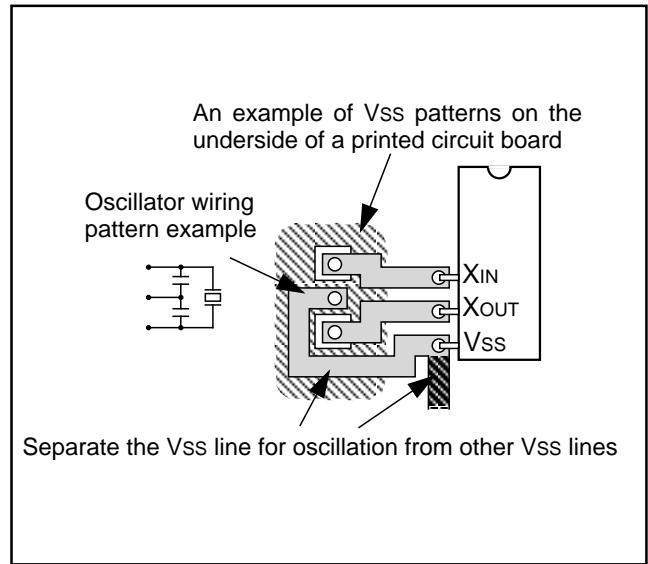

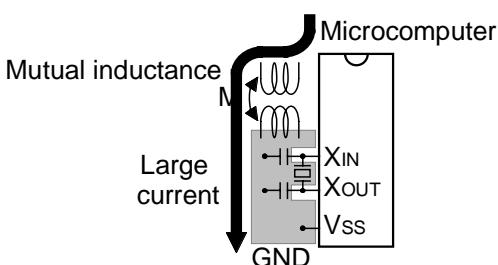

Fig. 91 Vss pattern on the underside of an oscillator

## ① Keeping oscillator away from large current signal lines

## ② Installing oscillator away from signal lines where potential levels change frequently

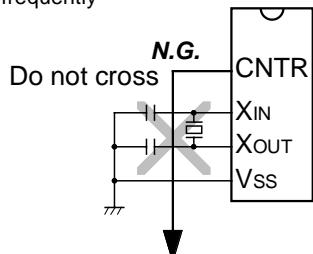

Fig. 90 Wiring for a large current signal line/Writing of signal lines where potential levels change frequently

## 5. Setup for I/O ports

Setup I/O ports using hardware and software as follows:

## &lt;Hardware&gt;

- Connect a resistor of  $100\ \Omega$  or more to an I/O port in series.

## &lt;Software&gt;

- As for an input port, read data several times by a program for checking whether input levels are equal or not.
- As for an output port, since the output data may reverse because of noise, rewrite data to its port latch at fixed periods.
- Rewrite data to direction registers and pull-up control registers at fixed periods.

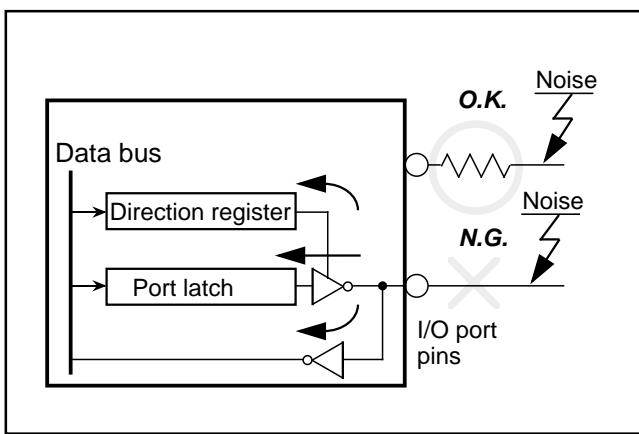

Fig. 92 Setup for I/O ports

## 6. Providing of watchdog timer function by software

If a microcomputer runs away because of noise or others, it can be detected by a software watchdog timer and the microcomputer can be reset to normal operation. This is equal to or more effective than program runaway detection by a hardware watchdog timer. The following shows an example of a watchdog timer provided by software.

In the following example, to reset a microcomputer to normal operation, the main routine detects errors of the interrupt processing routine and the interrupt processing routine detects errors of the main routine.

This example assumes that interrupt processing is repeated multiple times in a single main routine processing.

## &lt;The main routine&gt;

- Assigns a single byte of RAM to a software watchdog timer (SWDT) and writes the initial value N in the SWDT once at each execution of the main routine. The initial value N should satisfy the following condition:  
 $N+1 \geq (\text{Counts of interrupt processing executed in each main routine})$
- As the main routine execution cycle may change because of an interrupt processing or others, the initial value N should have a margin.
- Watches the operation of the interrupt processing routine by comparing the SWDT contents with counts of interrupt processing after the initial value N has been set.
- Detects that the interrupt processing routine has failed and determines to branch to the program initialization routine for recovery processing in the following case:  
If the SWDT contents do not change after interrupt processing.

## &lt;The interrupt processing routine&gt;

- Decrements the SWDT contents by 1 at each interrupt processing.
- Determines that the main routine operates normally when the SWDT contents are reset to the initial value N at almost fixed cycles (at the fixed interrupt processing count).
- Detects that the main routine has failed and determines to branch to the program initialization routine for recovery processing in the following case:  
If the SWDT contents are not initialized to the initial value N but continued to decrement and if they reach 0 or less.

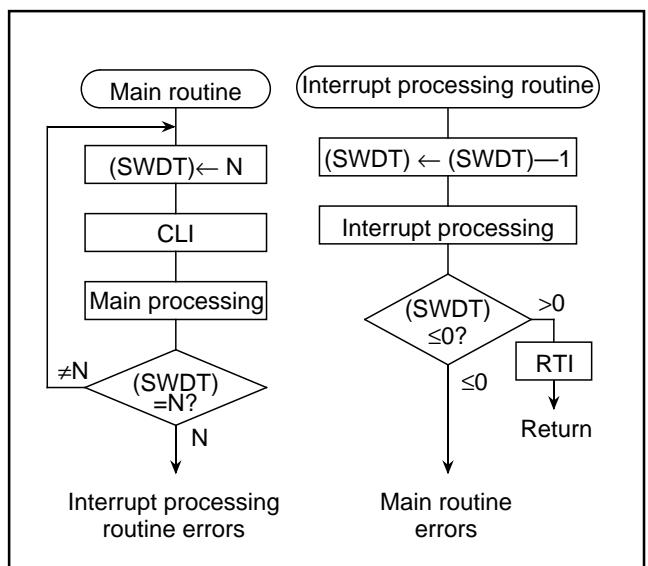

Fig. 93 Watchdog timer by software

ΣI <sub>OL</sub> (avg)	"L" total average output current (Note 2) P00–P07, P30–P34, P37			40	mA

**Note 1:** V<sub>CC</sub> = 4.0 to 5.5V

**2:** The total output current is the sum of all the currents flowing through all the applicable ports. The total average current is an average value measured over 100 ms. The total peak current is the peak value of all the currents.

## Recommended operating conditions (2)

(V<sub>CC</sub> = 1.8 to 5.5V, V<sub>SS</sub> = 0 V, T<sub>A</sub> = -20 to 85 °C, unless otherwise noted)

Symbol	Parameter	Limits			Unit
		Min.	Typ.	Max.	
I <sub>OH</sub> (peak)	"H" peak output current (Note 1) P00–P07, P10–P14, P20–P25, P30–P34, P37			-10	mA
I <sub>OL</sub> (peak)	"L" peak output current (Note 1) P00–P07, P30–P34, P37 (Drive capacity = "L") P10–P14, P20–P25			10	mA
I <sub>OL</sub> (peak)	"L" peak output current (Note 1) P00–P07, P30–P34, P37 (Drive capacity = "H")			30	mA
I <sub>OH</sub> (avg)	"H" average output current (Note 2) P00–P07, P10–P14, P20–P25, P30–P34, P37			-5	mA
I <sub>OL</sub> (avg)	"L" average output current (Note 2) P00–P07, P30–P34, P37 (Drive capacity = "L") P10–P14, P20–P25			5	mA
I <sub>OL</sub> (avg)	"L" average output current (Note 2) P00–P07, P30–P34, P37 (Drive capacity = "H")			15	mA
f(XIN)	Oscillation frequency (Note 3) at ceramic oscillation or external clock input (V <sub>CC</sub> = 4.5 V to 5.5 V) Double-speed mode			8	MHz
	Oscillation frequency (Note 3) at ceramic oscillation or external clock input (V <sub>CC</sub> = 4.0 V to 5.5 V) Double-speed mode			6.5	MHz
	Oscillation frequency (Note 3) at ceramic oscillation or external clock input (V <sub>CC</sub> = 2.4 V to 5.5 V) Double-speed mode			2	MHz
	Oscillation frequency (Note 3) at ceramic oscillation or external clock input (V <sub>CC</sub> = 2.2 V to 5.5 V) Double-speed mode			1	MHz
	Oscillation frequency (Note 3) at ceramic oscillation or external clock input (V <sub>CC</sub> = 4.0 V to 5.5 V) High-, Middle-speed mode			8	MHz
	Oscillation frequency (Note 3) at ceramic oscillation or external clock input (V <sub>CC</sub> = 2.4 V to 5.5 V) High-, Middle-speed mode			4	MHz
	Oscillation frequency (Note 3) at ceramic oscillation or external clock input (V <sub>CC</sub> = 2.2 V to 5.5 V) High-, Middle-speed mode			2	MHz
	Oscillation frequency (Note 3) at RC oscillation (V <sub>CC</sub> = 4.0 V to 5.5 V) High-, Middle-speed mode			4	MHz
	Oscillation frequency (Note 3) at RC oscillation (V <sub>CC</sub> = 2.4 V to 5.5 V) High-, Middle-speed mode			2	MHz
	Oscillation frequency (Note 3) at RC oscillation (V <sub>CC</sub> = 2.2 V to 5.5 V) High-, Middle-speed mode			1	MHz

Notes 1: The peak output current is the peak current flowing in each port.

2: The average output current I<sub>OL</sub> (avg), I<sub>OH</sub> (avg) in an average value measured over 100 ms.

3: When the oscillation frequency has a duty cycle of 50 %.

## Electrical Characteristics

### Electrical characteristics (1)

(V<sub>CC</sub> = 1.8 to 5.5V, V<sub>SS</sub> = 0 V, Ta = -20 to 85 °C, unless otherwise noted)

Symbol	Parameter	Test conditions	Limits			Unit
			Min.	Typ.	Max.	
V <sub>OH</sub>	"H" output voltage P00–P07, P10–P14, P20–P25, P30–P34, P37 (Note 1)	I <sub>OH</sub> = -5 mA V <sub>CC</sub> = 4.0 to 5.5 V	V <sub>CC</sub> –1.5			V
		I <sub>OH</sub> = -1.0 mA V <sub>CC</sub> = 1.8 to 5.5 V	V <sub>CC</sub> –1.0			V
V <sub>OL</sub>	"L" output voltage P00–P07, P30–P34, P37 (Drive capacity = "L") P10–P14, P20–P25	I <sub>OL</sub> = 5 mA V <sub>CC</sub> = 4.0 to 5.5 V			1.5	V
		I <sub>OL</sub> = 1.5 mA V <sub>CC</sub> = 4.0 to 5.5 V			0.3	V
		I <sub>OL</sub> = 1.0 mA V <sub>CC</sub> = 1.8 to 5.5 V			1.0	V
V <sub>OL</sub>	"L" output voltage P00–P07, P30–P34, P37 (Drive capacity = "H")	I <sub>OL</sub> = 15 mA V <sub>CC</sub> = 4.0 to 5.5 V			2.0	V
		I <sub>OL</sub> = 1.5 mA V <sub>CC</sub> = 4.0 to 5.5 V			0.3	V
		I <sub>OL</sub> = 1.0 mA V <sub>CC</sub> = 1.8 to 5.5 V			1.0	V
V <sub>T+</sub> –V <sub>T-</sub>	Hysteresis CNTR0, INT0, INT1, CAP0, CAP1 (Note 2) P00–P07 (Note 3)			0.4		V
V <sub>T+</sub> –V <sub>T-</sub>	Hysteresis RXD0, SCLK0, RXD1, SCLK1			0.5		V
V <sub>T+</sub> –V <sub>T-</sub>	Hysteresis RESET			0.5		V
I <sub>IH</sub>	"H" input current P00–P07, P10–P14, P20–P25, P30–P34, P37	V <sub>I</sub> = V <sub>CC</sub> (Pin floating. Pull up transistors "off")			5.0	µA
I <sub>IH</sub>	"H" input current RESET	V <sub>I</sub> = V <sub>CC</sub>			5.0	µA
I <sub>IH</sub>	"H" input current XIN	V <sub>I</sub> = V <sub>CC</sub>		4.0		µA
I <sub>IL</sub>	"L" input current P00–P07, P10–P14, P20–P25, P30–P34, P37	V <sub>I</sub> = V <sub>SS</sub> (Pin floating. Pull up transistors "off")			-5.0	µA
I <sub>IL</sub>	"L" input current RESET	V <sub>I</sub> = V <sub>SS</sub>			-5.0	µA
I <sub>IL</sub>	"L" input current XIN	V <sub>I</sub> = V <sub>SS</sub>		-4.0		µA
I <sub>IL</sub>	"L" input current P00–P07, P30–P34, P37	V <sub>I</sub> = V <sub>SS</sub> (Pull up transistors "on")		-0.2	-0.5	mA
V <sub>RAM</sub>	RAM hold voltage	When clock stopped	1.6		5.5	V
Rosc	On-chip oscillator oscillation frequency	V <sub>CC</sub> = 5.0 V, Ta = 25 °C	1000	2000	3000	kHz
Dosc	Oscillation stop detection circuit detection frequency	V <sub>CC</sub> = 5.0 V, Ta = 25 °C	62.5	125	187.5	kHz

**Notes1:** P11 is measured when the P11/TxD1 P-channel output disable bit of the UART1 control register (bit 4 of address 001B16) is "0".

P05 is measured when the P05/TxD2 P-channel output disable bit of the UART2 control register (bit 4 of address 003116) is "0".

**2:** RXD1, SCLK1 and INT0 have hystereses only when bits 0 to 2 of the port P1P3 control register are set to "0" (CMOS level).

**3:** It is available only when operating key-on wake up.

**Electrical characteristics (2)**  
 (V<sub>CC</sub> = 1.8 to 5.5V, V<sub>SS</sub> = 0 V, T<sub>A</sub> = -20 to 85 °C, unless otherwise noted)

Symbol	Parameter	Test conditions	Limits			Unit
			Min.	Typ.	Max.	
ICC	Power source current *LVD is valid (except at STP)	f(XIN) = 8 MHz Output transistors "off"	Double-speed mode		5.9	9.5 mA
			High-speed mode		3.9	7.0 mA
			Middle-speed mode		2.4	5.5 mA
	f(XIN) = 2 MHz, V <sub>CC</sub> = 2.2 V Output transistors "off"		High-speed mode		0.45	1.25 mA
		On-chip oscillator operation mode, Output transistors "off"	Frequency/1		1.55	3.3 mA
			Frequency/2		0.95	2.3 mA
			Frequency/8		0.4	1.1 mA
	f(XIN) = 8 MHz (in WIT state), functions except timer 1 disabled, Output transistors "off"		Frequency/128		0.25	0.7 mA
					2.0	3.5 mA
					0.25	
	On-chip oscillator operation mode, (in WIT state), functions except timer 1 disabled, Output transistors "off"				0.25	0.7 mA
					0.25	
		Increment when A/D conversion is executed f(XIN) = 8 MHz, V <sub>CC</sub> = 5 V			0.5	
	All oscillation stopped (in STP state) Output transistors "off"	T <sub>A</sub> = 25 °C			0.1	1.0 μA
		T <sub>A</sub> = 85 °C				10 μA
	Low voltage detection circuit self consumption current	T <sub>A</sub> = 25 °C V <sub>CC</sub> = 5 V			70	

**Note:** Increment when A/D conversion is executed includes the reference power source input current (I<sub>VREF</sub>).

## A/D Converter Characteristics

### A/D Converter characteristics

(V<sub>CC</sub> = 2.7 to 5.5 V, V<sub>SS</sub> = 0 V, T<sub>a</sub> = -20 to 85 °C, unless otherwise noted)

Symbol	Parameter	Test conditions	Limits			Unit
			Min.	Typ.	Max.	
—	Resolution				10	Bits
—	Absolute accuracy	T <sub>a</sub> = 25 °C V <sub>CC</sub> = V <sub>REF</sub> = 2.7 to 5.5 V			±3	LSB
t <sub>CONV</sub>	Conversion time	AD conversion clock = f(X <sub>IN</sub> )/2			122	t <sub>c</sub> (X <sub>IN</sub> )
		AD conversion clock = f(X <sub>IN</sub> )			61	
R <sub>LADDER</sub>	Ladder resistor			55		kΩ
I <sub>VREF</sub>	Reference power source input current	V <sub>REF</sub> = 5.0 V	50	150	200	μA
		V <sub>REF</sub> = 3.0 V	30	90	120	
I <sub>II(AD)</sub>	A/D port input current				5.0	μA

**Note:** AD conversion accuracy may be low under the following conditions;

(1) When the V<sub>REF</sub> voltage is set to be lower than the V<sub>CC</sub> voltage, an analog circuit in this microcomputer is affected by noise.

The accuracy is lower than the case the V<sub>REF</sub> voltage is the same as V<sub>CC</sub> voltage.

(2) When the V<sub>REF</sub> voltage is 3.0 V or less at the low temperature, the AD conversion accuracy may be very lower than at room temperature.

When system is used at low temperature, that V<sub>REF</sub> is 3.0 V or more is recommended.

## Power-on reset circuit characteristics

### Power-on reset circuit characteristics

(Vcc = 1.8 to 5.5 V, Vss = 0 V, Ta = -20 to 85 °C, unless otherwise noted)

Symbol	Parameter	Test conditions	Limits			Unit
			Min.	Typ.	Max.	
VPOR	Valid start voltage of power-on reset circuit (Note)				0	mV
TW(VPOR)	VPOR hold time	TW(VPOR) > 10 s			10	s
TW(VPOR-VDET)	Rising time of valid power source of power-on reset circuit				20	ms

**Note:** VPOR is the start voltage level of Vcc for the built-in power-on reset circuit to operate normally.

Keep VPOR to be lower than the Vcc voltage before rising of the Vcc power source to use the built-in power-on reset circuit.

Set the built-in low voltage detection circuit to be valid when the built-in power-on reset is used.

## Low voltage detection circuit characteristics

### Low voltage detection circuit characteristics

(Vcc = 1.8 to 5.5 V, Vss = 0 V, Ta = -20 to 85 °C, unless otherwise noted)

Symbol	Parameter	Test conditions	Limits			Unit
			Min.	Typ.	Max.	
VLVD	Valid start voltage of low voltage detection circuit (Note)		1.0		0	V
TW(VLVD)	VLVD hold time				10	s
TW(VLVD-VDET)	Rising time of valid power source of low voltage detection circuit	TW(VLVD) > 10 s			10	s
VDET-	Detection voltage of low voltage detection circuit	Ta = 0 to 50 °C	1.85	1.95	2.05	V
V(VDET+-VDET-)	Detection voltage Hysteresis (when hysteresis is valid)	Ta = -20 to 85 °C	1.8	1.95	2.1	V
TDET	Detection time of low voltage detection circuit		0.1			μs

**Note:** VLVD is the start voltage level of Vcc for the built-in low voltage detection circuit to operate normally.

If the Vcc power source becomes lower than VLVD, first set the Vcc voltage to be lower than VPOR. Next, according to the electrical characteristics of the power-on reset circuit, perform the rising of Vcc.

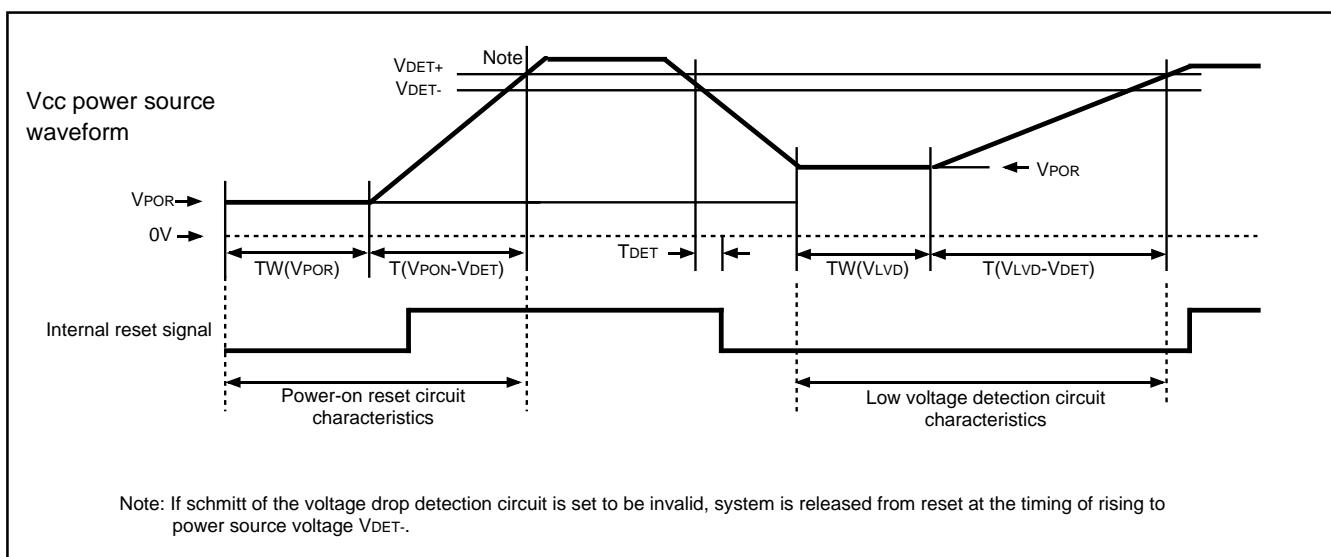

Fig. 94 Electrical characteristics of power-on reset circuit and voltage drop detection circuit

## Timing Requirements

**Table 22 Timing requirements (1)**  
( $V_{CC} = 4.0$  to  $5.5$  V,  $V_{SS} = 0$  V,  $T_a = -20$  to  $85$  °C, unless otherwise noted)

Symbol	Parameter	Limits			Unit
		Min.	Typ.	Max.	
$tw(\overline{RESET})$	Reset input "L" pulse width	2			μs
$tc(XIN)$	External clock input cycle time	125			ns
$twh(XIN)$	External clock input "H" pulse width	50			ns
$twl(XIN)$	External clock input "L" pulse width	50			ns
$tc(CNTR0)$	CNTR0 input cycle time	200			ns
$twh(CNTR0)$	CNTR0, INT0, INT1, CAP0, CAP1 input "H" pulse width (Note 1)	80			ns
$twl(CNTR0)$	CNTR0, INT0, INT1, CAP0, CAP1 input "L" pulse width (Note 1)	80			ns
$tc(SCLK1)$	Serial I/O1, serial I/O2 clock input cycle time (Note 2)	800			ns
$twh(SCLK1)$	Serial I/O1, serial I/O2 clock input "H" pulse width (Note 2)	370			ns
$twl(SCLK1)$	Serial I/O1, serial I/O2 clock input "L" pulse width (Note 2)	370			ns
$tsu(RxD1-SCLK1)$	Serial I/O1, serial I/O2 input set up time	220			ns
$th(SCLK1-RxD1)$	Serial I/O1, serial I/O2 input hold time	100			ns

**Notes 1:** As for CAP0, CAP1, it is the value when noise filter is not used.

**2:** In this time, bit 6 of the serial I/O1 control register (address 001A16) is set to "1" (clock synchronous serial I/O is selected).

When bit 6 of the serial I/O1 control register is "0" (clock asynchronous serial I/O is selected), the rating values are divided by 4.

**In this time, bit 6 of the serial I/O2 control register (address 003016) is set to "1" (clock synchronous serial I/O is selected).**

When bit 6 of the serial I/O2 control register is "0" (clock asynchronous serial I/O is selected), the rating values are divided by 4.

**Table 23 Timing requirements (2)**

( $V_{CC} = 2.4$  to  $5.5$  V,  $V_{SS} = 0$  V,  $T_a = -20$  to  $85$  °C, unless otherwise noted)

Symbol	Parameter	Limits			Unit
		Min.	Typ.	Max.	
$tw(\overline{RESET})$	Reset input "L" pulse width	2			μs
$tc(XIN)$	External clock input cycle time	250			ns
$twh(XIN)$	External clock input "H" pulse width	100			ns
$twl(XIN)$	External clock input "L" pulse width	100			ns
$tc(CNTR0)$	CNTR0 input cycle time	500			ns
$twh(CNTR0)$	CNTR0, INT0, INT1, CAP0, CAP1 input "H" pulse width (Note 1)	230			ns
$twl(CNTR0)$	CNTR0, INT0, INT1, CAP0, CAP1 input "L" pulse width (Note 1)	230			ns
$tc(SCLK1)$	Serial I/O1, serial I/O2 clock input cycle time (Note 2)	2000			ns
$twh(SCLK1)$	Serial I/O1, serial I/O2 clock input "H" pulse width (Note 2)	950			ns
$twl(SCLK1)$	Serial I/O1, serial I/O2 clock input "L" pulse width (Note 2)	950			ns
$tsu(RxD1-SCLK1)$	Serial I/O1, serial I/O2 input set up time	400			ns
$th(SCLK1-RxD1)$	Serial I/O1, serial I/O2 input hold time	200			ns

**Notes 1:** As for CAP0, CAP1, it is the value when noise filter is not used.

**2:** In this time, bit 6 of the serial I/O1 control register (address 001A16) is set to "1" (clock synchronous serial I/O is selected).

When bit 6 of the serial I/O1 control register is "0" (clock asynchronous serial I/O is selected), the rating values are divided by 4.

**In this time, bit 6 of the serial I/O2 control register (address 003016) is set to "1" (clock synchronous serial I/O is selected).**

When bit 6 of the serial I/O2 control register is "0" (clock asynchronous serial I/O is selected), the rating values are divided by 4.

**Table 24 Timing requirements (3)**  
( $V_{CC} = 2.2$  to  $5.5$  V,  $V_{SS} = 0$  V,  $T_a = -20$  to  $85$  °C, unless otherwise noted)

Symbol	Parameter	Limits			Unit
		Min.	Typ.	Max.	
tw(RESET)	Reset input "L" pulse width	2			μs
tc(XIN)	External clock input cycle time	500			ns
twh(XIN)	External clock input "H" pulse width	200			ns
twL(XIN)	External clock input "L" pulse width	200			ns
tc(CNTR0)	CNTR0 input cycle time	1000			ns
twh(CNTR0)	CNTR0, INT0, INT1, CAP0, CAP1 input "H" pulse width (Note 1)	460			ns
twL(CNTR0)	CNTR0, INT0, INT1, CAP0, CAP1 input "L" pulse width (Note 1)	460			ns
tc(SCLK1)	Serial I/O1, serial I/O2 clock input cycle time (Note 2)	4000			ns
twh(SCLK1)	Serial I/O1, serial I/O2 clock input "H" pulse width (Note 2)	1900			ns
twL(SCLK1)	Serial I/O1, serial I/O2 clock input "L" pulse width (Note 2)	1900			ns
tsu(RxD1–SCLK1)	Serial I/O1, serial I/O2 input set up time	800			ns
th(SCLK1–RxD1)	Serial I/O1, serial I/O2 input hold time	400			ns

**Notes 1:** As for CAP0, CAP1, it is the value when noise filter is not used.

**2:** In this time, bit 6 of the serial I/O1 control register (address 001A16) is set to "1" (clock synchronous serial I/O is selected).

When bit 6 of the serial I/O1 control register is "0" (clock asynchronous serial I/O1 is selected), the rating values are divided by 4.

In this time, bit 6 of the serial I/O2 control register (address 003016) is set to "1" (clock synchronous serial I/O is selected).

When bit 6 of the serial I/O2 control register is "0" (clock asynchronous serial I/O is selected), the rating values are divided by 4.

## Switching Characteristics

**Table 25 Switching characteristics (1)**

( $V_{CC} = 4.0$  to  $5.5$  V,  $V_{SS} = 0$  V,  $T_a = -20$  to  $85$  °C, unless otherwise noted)

Symbol	Parameter	Limits			Unit
		Min.	Typ.	Max.	
$t_{WH}(SCLK1)$	Serial I/O1, serial I/O2 clock output "H" pulse width	$t_{C}(SCLK1)/2-30$			ns
$t_{WL}(SCLK1)$	Serial I/O1, serial I/O2 clock output "L" pulse width	$t_{C}(SCLK1)/2-30$			ns
$t_d(SCLK1-TxD1)$	Serial I/O1, serial I/O2 output delay time			140	ns
$t_v(SCLK1-TxD1)$	Serial I/O1, serial I/O2 output valid time	-30			ns
$t_r(SCLK1)$	Serial I/O1, serial I/O2 clock output rising time			30	ns
$t_f(SCLK1)$	Serial I/O1, serial I/O2 clock output falling time			30	ns
$t_r(CMOS)$	CMOS output rising time (Note 1)		10	30	ns
$t_f(CMOS)$	CMOS output falling time (Note 1)		10	30	ns

Note 1: Pin XOUT is excluded.

**Table 26 Switching characteristics (2)**

( $V_{CC} = 2.4$  to  $5.5$  V,  $V_{SS} = 0$  V,  $T_a = -20$  to  $85$  °C, unless otherwise noted)

Symbol	Parameter	Limits			Unit
		Min.	Typ.	Max.	
$t_{WH}(SCLK1)$	Serial I/O1, serial I/O2 clock output "H" pulse width	$t_{C}(SCLK1)/2-50$			ns
$t_{WL}(SCLK1)$	Serial I/O1, serial I/O2 clock output "L" pulse width	$t_{C}(SCLK1)/2-50$			ns
$t_d(SCLK1-TxD1)$	Serial I/O1, serial I/O2 output delay time			350	ns
$t_v(SCLK1-TxD1)$	Serial I/O1, serial I/O2 output valid time	-30			ns
$t_r(SCLK1)$	Serial I/O1, serial I/O2 clock output rising time			50	ns
$t_f(SCLK1)$	Serial I/O1, serial I/O2 clock output falling time			50	ns
$t_r(CMOS)$	CMOS output rising time (Note 1)		20	50	ns
$t_f(CMOS)$	CMOS output falling time (Note 1)		20	50	ns

Note 1: Pin XOUT is excluded.

**Table 27 Switching characteristics (3)**

( $V_{CC} = 2.2$  to  $5.5$  V,  $V_{SS} = 0$  V,  $T_a = -20$  to  $85$  °C, unless otherwise noted)

Symbol	Parameter	Limits			Unit
		Min.	Typ.	Max.	
$t_{WH}(SCLK1)$	Serial I/O1, serial I/O2 clock output "H" pulse width	$t_{C}(SCLK1)/2-70$			ns
$t_{WL}(SCLK1)$	Serial I/O1, serial I/O2 clock output "L" pulse width	$t_{C}(SCLK1)/2-70$			ns
$t_d(SCLK1-TxD1)$	Serial I/O1, serial I/O2 output delay time			450	ns
$t_v(SCLK1-TxD1)$	Serial I/O1, serial I/O2 output valid time	-30			ns
$t_r(SCLK1)$	Serial I/O1, serial I/O2 clock output rising time			70	ns
$t_f(SCLK1)$	Serial I/O1, serial I/O2 clock output falling time			70	ns
$t_r(CMOS)$	CMOS output rising time (Note 1)		25	70	ns
$t_f(CMOS)$	CMOS output falling time (Note 1)		25	70	ns

Note 1: Pin XOUT is excluded.

## APPENDIX

### NOTES ON PROGRAMMING

#### 1. Processor Status Register

##### (1) Initializing of processor status register

Flags which affect program execution must be initialized after a reset.

In particular, it is essential to initialize the T and D flags because they have an important effect on calculations.

<Reason>

After a reset, the contents of the processor status register (PS) are undefined except for the I flag which is "1".

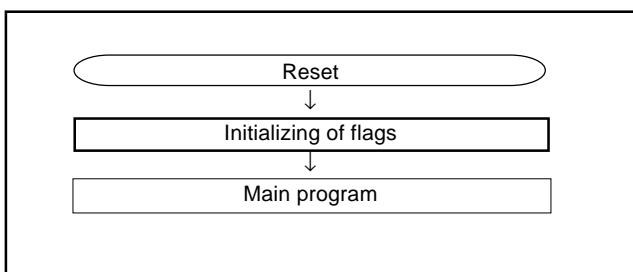

Fig. 1 Initialization of processor status register

##### (2) How to reference the processor status register

To reference the contents of the processor status register (PS), execute the **PHP** instruction once then read the contents of (S+1). If necessary, execute the **PLP** instruction to return the PS to its original status.

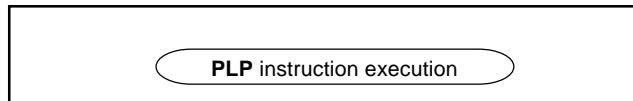

Fig. 2 Sequence of PLP instruction execution

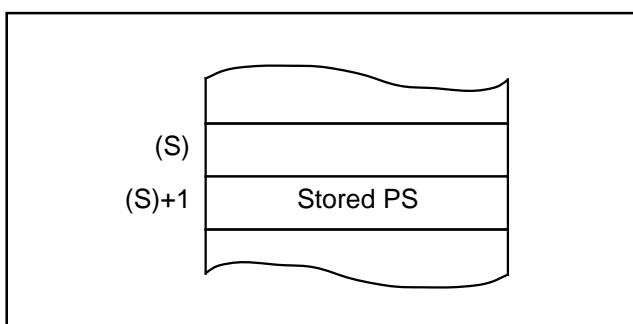

Fig. 3 Stack memory contents after PHP instruction execution

#### 2. Decimal calculations

##### (1) Execution of decimal calculations

The **ADC** and **SBC** are the only instructions which will yield proper decimal notation, set the decimal mode flag (D) to "1" with the **SED** instruction. After executing the **ADC** or **SBC** instruction, execute another instruction before executing the **SEC**, **CLC**, or **CLD** instruction.

##### (2) Notes on status flag in decimal mode

When decimal mode is selected, the values of three of the flags in the status register (the N, V, and Z flags) are invalid after a **ADC** or **SBC** instruction is executed.

The carry flag (C) is set to "1" if a carry is generated as a result of the calculation, or is cleared to "0" if a borrow is generated. To determine whether a calculation has generated a carry, the C flag must be initialized to "0" before each calculation. To check for a borrow, the C flag must be initialized to "1" before each calculation.

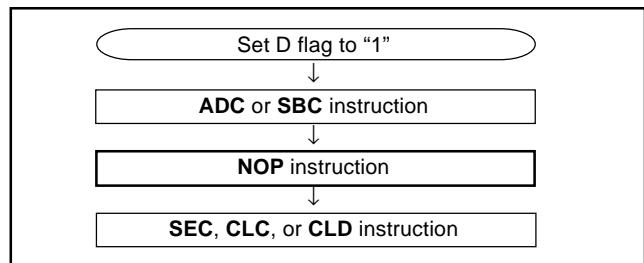

Fig. 4 Status flag at decimal calculations

#### 3. JMP instruction

When using the **JMP** instruction in indirect addressing mode, do not specify the last address on a page as an indirect address.

#### 4. Multiplication and Division Instructions

(1) The index X mode (T) and the decimal mode (D) flags do not affect the **MUL** and **DIV** instruction.

(2) The execution of these instructions does not change the contents of the processor status register.

#### 5. Read-modify-write instruction

Do not execute a read-modify-write instruction to the read invalid address (SFR).

The read-modify-write instruction operates in the following sequence: read one-byte of data from memory, modify the data, write the data back to original memory. The following instructions are classified as the read-modify-write instructions in the 740 Family.

(1) Bit management instructions: CLB, SEB

(2) Shift and rotate instructions: ASL, LSR, ROL, ROR, RRF

(3) Add and subtract instructions: DEC, INC

(4) Logical operation instructions (1's complement): COM

Add and subtract/logical operation instructions (ADC, SBC, AND, EOR, and ORA) when T flag = "1" operate in the way as the read-modify-write instruction. Do not execute the read invalid SFR.

<Reason>

When the read-modify-write instruction is executed to read invalid SFR, the instruction may cause the following consequence: the instruction reads unspecified data from the area due to the read invalid condition. Then the instruction modifies this unspecified data and writes the data to the area. The result will be random data written to the area or some unexpected event.

## NOTES ON PERIPHERAL FUNCTIONS

### Notes on I/O Ports

#### 1. Port direction register

- Set bits 6 and 7 of port P2 direction register to "1".
- Set bits 5 and 6 of port P3 direction register to "1".

#### 2. Interrupt edge selection register

Set bit 2 of interrupt edge selection register to "1".

#### 3. Be sure to set bit 1 of port P1P3 control register (address 1716) to "0".

#### 4. Port P0P3 drive capacity control register

The number of LED drive port (drive capacity is HIGH) is 8.

#### 5. Pull-up control register

When using each port which built in pull-up resistor as an output port, the pull-up control bit of corresponding port becomes invalid, and pull-up resistor is not connected.

##### <Reason>

Pull-up control is effective only when each direction register is set to the input mode.

#### 6. Notes in stand-by state

In stand-by state<sup>\*1</sup> for low-power dissipation, do not make input levels of an input port and an I/O port "undefined".

Pull-up (connect the port to Vcc) or pull-down (connect the port to Vss) these ports through a resistor.

When determining a resistance value, note the following points:

- External circuit
- Variation of output levels during the ordinary operation

When using a built-in pull-up resistor, note on varied current values:

- When setting as an input port : Fix its input level
- When setting as an output port : Prevent current from flowing out to external.

##### <Reason>

The output transistor becomes the OFF state, which causes the ports to be the high-impedance state. Note that the level becomes "undefined" depending on external circuits.

Accordingly, the potential which is input to the input buffer in a microcomputer is unstable in the state that input levels of an input port and an I/O port are "undefined". This may cause power source current.

<sup>\*1</sup> stand-by state : the stop mode by executing the **STP** instruction  
the wait mode by executing the **WIT** instruction

#### 7. Modifying output data with bit managing instruction

When the port latch of an I/O port is modified with the bit managing instruction<sup>\*2</sup>, the value of the unspecified bit may be changed.

##### <Reason>

The bit managing instructions are read-modify-write form instructions for reading and writing data by a byte unit. Accordingly, when these instructions are executed on a bit of the port latch of an I/O port, the following is executed to all bits of the port latch.

- As for a bit which is set for an input port :  
The pin state is read in the CPU, and is written to this bit after bit managing.
- As for a bit which is set for an output port :  
The bit value of the port latch is read in the CPU, and is written to this bit after bit managing.

Note the following :

- Even when a port which is set as an output port is changed for an input port, its port latch holds the output data.
- As for a bit of the port latch which is set for an input port, its value may be changed even when not specified with a bit managing instruction in case where the pin state differs from its port latch contents.

<sup>\*2</sup> bit managing instructions : **SEB**, and **CLB** instructions

## 8. Direction register

The values of the port direction registers cannot be read. That is, it is impossible to use the **LDA** instruction, memory operation instruction when the T flag is "1", addressing mode using direction register values as qualifiers, and bit test instructions such as **BBC** and **BBS**.

It is also impossible to use bit operation instructions such as **CLB** and **SEB** and read-modify-write instructions of direction registers for calculations such as **ROR**.

For setting direction registers, use the **LDM** instruction, **STA** instruction, etc.

## Termination of Unused Pins

### 1. Terminate unused pins

Perform the following wiring at the shortest possible distance (20 mm or less) from microcomputer pins.

#### (1) I/O ports

Set the I/O ports for the input mode and connect each pin to Vcc or Vss through each resistor of 1 kΩ to 10 kΩ. The port which can select a built-in pull-up resistor can also use the built-in pull-up resistor.

When using the I/O ports as the output mode, open them at "L" or "H".

- When opening them in the output mode, the input mode of the initial status remains until the mode of the ports is switched over to the output mode by the program after reset. Thus, the potential at these pins is undefined and the power source current may increase in the input mode. With regard to an effects on the system, thoroughly perform system evaluation on the user side.
- Since the direction register setup may be changed because of a program runaway or noise, set direction registers by program periodically to increase the reliability of program.

### 2. Termination remarks

#### (1) I/O ports setting as input mode

[1] Do not open in the input mode.

##### <Reason>

- The power source current may increase depending on the first-stage circuit.
- An effect due to noise may be easily produced as compared with proper termination (1) shown on the above "1. Terminate unused pins".

[2] Do not connect to Vcc or Vss directly.

##### <Reason>

If the direction register setup changes for the output mode because of a program runaway or noise, a short circuit may occur.

[3] Do not connect multiple ports in a lump to Vcc or Vss through a resistor.

##### <Reason>

If the direction register setup changes for the output mode because of a program runaway or noise, a short circuit may occur between ports.

## Notes on Interrupts

### 1. Change of relevant register settings

When not requiring for the interrupt occurrence synchronous with the following case, take the sequence shown in Figure 5.

- When switching external interrupt active edge
- When switching interrupt sources of an interrupt vector address where two or more interrupt sources are allocated

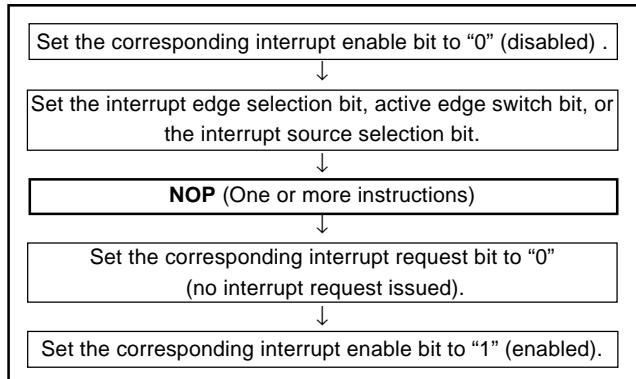

Fig. 5 Sequence of changing relevant register

### <Reason>

When setting the followings, the interrupt request bit of the corresponding interrupt may be set to "1".

- When switching external interrupt active edge
  - INT0 interrupt edge selection bit  
(bit 0 of Interrupt edge selection register (address 3A16))
  - INT1 interrupt edge selection bit  
(bit 1 of Interrupt edge selection register)
  - CNTR0 active edge switch bit  
(bit 2 of timer X mode register (address 2B16))
  - Capture 0 interrupt edge selection bit  
(bits 1 and 0 of capture mode register (address 2016))
  - Capture 1 interrupt edge selection bit  
(bits 3 and 2 of capture mode register)

### 2. Check of interrupt request bit

When executing the **BBC** or **BBS** instruction to determine an interrupt request bit immediately after this bit is set to "0", take the following sequence.

##### <Reason>

If the BBC or BBS instruction is executed immediately after an interrupt request bit is cleared to "0", the value of the interrupt request bit before being cleared to "0" is read.

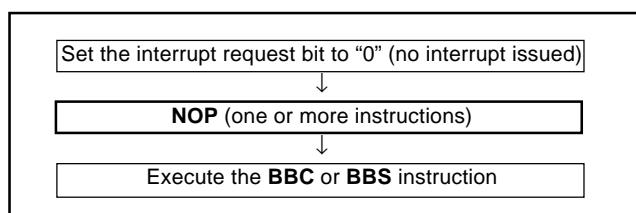

Fig. 6 Sequence of check of interrupt request bit

### 3. Interrupt discrimination bit

Use an LDM instruction to clear to "0" an interrupt discrimination bit.

LDM #0000XXXX, \$0B

Set the following values to "X"

"0": an interrupt discrimination bit to clear

"1": other interrupt discrimination bits

Ex.) When a key-on wakeup interrupt discrimination bit is cleared;  
LDM #00001110 and \$0B.

### 4. Interrupt discrimination bit and interrupt request bit

For key-on wakeup, UART1 bus collision detection, A/D conversion and Timer 1 interrupt, even if each interrupt valid bit (interrupt source set register (address 0A16)) is set "0: Invalid", each interrupt discrimination bit (interrupt source discrimination register (address 0B16)) is set to "1: interrupt occurs" when corresponding interrupt request occurs.

But corresponding interrupt request bit (interrupt request registers 1, 2 (addresses 3C16, 3D16) is not affected.

## Notes on Timers

1. When n (0 to 255) is written to a timer latch, the frequency division ratio is  $1/(n+1)$ .

2. When a count source of timer X, timer A or timer B is switched, stop a count of the timer.

## Notes on Timer X

### 1. CNTR0 interrupt active edge selection

CNTR0 interrupt active edge depends on the CNTR0 active edge switch bit (bit 2 of timer X mode register (address 2B16)).

When this bit is "0", the CNTR0 interrupt request bit is set to "1" at the falling edge of CNTR0 pin input signal. When this bit is "1", the CNTR0 interrupt request bit is set to "1" at the rising edge of CNTR0 pin input signal.

### 2. Timer X count source selection

The f(XIN) (frequency not divided) can be selected by the timer X count source selection bits (bits 1 and 0 of timer count source set register (address 2A16)) only when the ceramic oscillation or the on-chip oscillator is selected.

Do not select it for the timer X count source at the RC oscillation.

### 3. Pulse output mode

Set the direction register of port P14, which is also used as CNTR0 pin, to output.

When the TXOUT pin is used, set the direction register of port P03, which is also used as TXOUT pin, to output.

### 4. Pulse width measurement mode

Set the direction register of port P14, which is also used as CNTR0 pin, to input.

## Notes on Timer A, B

### 1. Setting of timer value

When "1: Write to only latch" is set to the timer A (B) write control bit (bit 0 (bit 2) of timer X mode register (address 1D16)), written data to timer register is set to only latch even if timer is stopped or operating. Accordingly, in order to set the initial value for timer when it is stopped, set "0: Write to latch and timer simultaneously" to timer A (B) write control bit.

### 2. Read/write of timer A

Stop timer A to read/write its data in the following state;  
XIN oscillation selected by clock division ratio selection bits (bits 7 and 6 of CPU mode register (address 3B16)), and the on-chip oscillator output is selected as the timer A count source.

### 3. Read/write of timer B

Stop timer B to read/write its data in the following state;  
XIN oscillation selected by clock division ratio selection bits, the timer A underflow is selected as the timer B count source, and the on-chip oscillator output is selected as the timer A count source.

## Notes on Output Compare

1. When the selected source timer of each compare channel is stopped, written data to compare register is loaded to the compare latch simultaneously.
2. Do not write the same data to both of compare latch x0 ( $x=0, 1, 2, 3$ ) and x1.
3. When setting value of the compare register is larger than timer setting value, compare match signal is not generated. Accordingly, the output waveform is fixed to "L" or "H" level. However, when setting value of another compare register is smaller than timer setting value, this compare match signal is generated. Accordingly, if the corresponding compare latch y ( $y=00, 01, 10, 11, 20, 21, 30, 31$ ) interrupt source bit is set to "1" (valid), compare match interrupt request occurs.
4. When the compare x trigger enable bit is cleared to "0" (disabled), the match trigger to the waveform output circuit is disabled. Accordingly, the output waveform can be fixed to "L" or "H" level. However, in this case, the compare match signal is generated. Accordingly, if the corresponding compare latch y ( $y=00, 01, 10, 11, 20, 21, 30, 31$ ) interrupt source bit is set to "1" (valid), compare match interrupt request occurs.

## Notes on Input Capture

1. If the capture trigger is input while the capture register (low-order and high-order) is in read, captured value is changed between high-order reading and low-order reading. Accordingly, some countermeasure by program is recommended, for example comparing the values that twice of read.
2. Timer A cannot be used for the capture source timer in the following state;
  - XIN oscillation selected by clock division ratio selection bits (bits 7 and 6 of CPU mode register (address 3B16))
  - Timer A count source: On-chip oscillator output.Timer B cannot be used for the capture source timer in the following state;
  - XIN oscillation selected by clock division ratio selection bits
  - Timer B count source: Timer A underflow
  - Timer A count source: On-chip oscillator output.
3. As shown below, when the capture input is performed to both capture latch 00 and 01 at the same time, the value of capture 0 status bit (bit 4 of capture/compare status register (address 2216)) is undefined (same as capture 1).
  - When "1" is written to capture latch 00 software trigger bit (bit 0 of capture software trigger register (address 1316)) and capture latch 01 software trigger bit (bit 1 of capture software trigger register) at the same time
  - When external trigger of capture latch 00 and software trigger of capture latch 01 occur at the same time
  - When external trigger of capture latch 01 and software trigger of capture latch 00 occur at the same time
4. When the capture interrupt is used as the interrupt for return from stop mode, set the capture 0 noise filter clock selection bits (bits 5 and 4 of capture mode register (address 2016)) to "00 (Filter stop)" (same as capture 1).

## Notes on Serial I/Oi (i=1, 2)

### 1. Clock synchronous serial I/O

(1) When the transmit operation is stopped, clear the serial I/Oi enable bit and the transmit enable bit to "0" (serial I/Oi and transmit disabled).

<Reason>

Since transmission is not stopped and the transmission circuit is not initialized even if only the serial I/Oi enable bit is cleared to "0" (serial I/Oi disabled), the internal transmission is running (in this case, since pins TxDi, RxDi, SCLKi, and SRDYi function as I/O ports, the transmission data is not output). When data is written to the transmit buffer register in this state, data starts to be shifted to the transmit shift register. When the serial I/Oi enable bit is set to "1" at this time, the data during internally shifting is output to the TxDi pin and an operation failure occurs.

(2) When the receive operation is stopped, clear the receive enable bit to "0" (receive disabled), or clear the serial I/Oi enable bit to "0" (serial I/Oi disabled).

(3) When the transmit/receive operation is stopped, clear both the transmit enable bit and receive enable bit to "0" (transmit and receive disabled) simultaneously. (any one of data transmission and reception cannot be stopped.)

<Reason>

In the clock synchronous serial I/O mode, the same clock is used for transmission and reception.

If any one of transmission and reception is disabled, a bit error occurs because transmission and reception cannot be synchronized. In this mode, the clock circuit of the transmission circuit also operates for data reception. Accordingly, the transmission circuit does not stop by clearing only the transmit enable bit to "0" (transmit disabled). Also, the transmission circuit cannot be initialized even if the serial I/Oi enable bit is cleared to "0" (serial I/Oi disabled) (same as (1)).

(4) When signals are output from the SRDYi pin on the reception side by using an external clock, set all of the receive enable bit, the SRDYi output enable bit, and the transmit enable bit to "1".

(5) When the SRDYi signal input is used, set the using pin to the input mode before data is written to the transmit/receive buffer register.

### 2. UART

When the transmit operation is stopped, clear the transmit enable bit to "0" (transmit disabled).

<Reason>

Same as (1) shown on the above "1. Clock synchronous serial I/O". When the receive operation is stopped, clear the receive enable bit to "0" (receive disabled).

When the transmit/receive operation is stopped, clear the transmit enable bit to "0" (transmit disabled) and receive enable bit to "0" (receive disabled).

### 3. Notes common to clock synchronous serial I/O and UART

(1) Set the serial I/Oi (i=1, 2) control register again after the transmission and the reception circuits are reset by clearing both the transmit enable bit and the receive enable bit to "0."

Clear both the transmit enable bit (TE) and the receive enable bit (RE) to "0"

Set the bits 0 to 3 and bit 6 of the serial I/Oi control register

Set both the transmit enable bit (TE) and the receive enable bit (RE), or one of them to "1"

Can be set with the **LDM** instruction at the same time

Fig. 7 Sequence of setting serial I/Oi control register again

(2) The transmit shift completion flag changes from "1" to "0" with a delay of 0.5 to 1.5 shift clocks. When data transmission is controlled with referring to the flag after writing the data to the transmit buffer register, note the delay.

(3) When data transmission is executed at the state that an external clock input is selected as the synchronous clock, set "1" to the transmit enable bit while the SCLKi is "H" state. Also, write to the transmit buffer register while the SCLKi is "H" state.

(4) When the transmit interrupt is used, set as the following sequence.

- ① Serial I/Oi transmit interrupt enable bit is set to "0" (disabled).
- ② Serial I/Oi transmit enable bit is set to "1".
- ③ Serial I/Oi transmit interrupt request bit is set to "0" after 1 or more instructions have been executed.
- ④ Serial I/Oi transmit interrupt enable bit is set to "1" (enabled).

<Reason>

When the transmit enable bit is set to "1", the transmit buffer empty flag and transmit shift completion flag are set to "1". Accordingly, even if the timing when any of the above flags is set to "1" is selected for the transmit interrupt source, interrupt request occurs and the transmit interrupt request bit is set.

(5) Write to the baud rate generator (BRGi) while the transmit/receive operation is stopped.

## Notes on Serial I/O1

### 1. I/O pin function when serial I/O1 is enabled.

The pin functions of P12/SCLK1 and P13/SDY1 are switched to as follows according to the setting values of a serial I/O1 mode selection bit (bit 6 of serial I/O1 control register (address 1A16)) and a serial I/O1 synchronous clock selection bit (bit 1 of serial I/O1 control register).

(1) Serial I/O1 mode selection bit → "1" :

Clock synchronous type serial I/O is selected.

• Setup of a serial I/O1 synchronous clock selection bit

"0" : P12 pin turns into an output pin of a synchronous clock.

"1" : P12 pin turns into an input pin of a synchronous clock.

• Setup of a SDY1 output enable bit (SDY)

"0" : P13 pin can be used as a normal I/O pin.

"1" : P13 pin turns into a SDY1 output pin.

(2) Serial I/O1 mode selection bit → "0" :

Clock asynchronous (UART) type serial I/O is selected.

• Setup of a serial I/O1 synchronous clock selection bit

"0": P12 pin can be used as a normal I/O pin.

"1": P12 pin turns into an input pin of an external clock.

• When clock asynchronous (UART) type serial I/O is selected, it functions P13 pin. It can be used as a normal I/O pin.

## Note on Bus Collision Detection

When serial I/O1 is operating at half-duplex communication, set bus collision detection interrupt to be disabled.

## Notes on Serial I/O2

### 1. I/O pin function when serial I/O2 is enabled

The pin functions of P06/SCLK2 and P07/SDY2 are switched to as follows according to the setting values of a serial I/O2 mode selection bit (bit 6 of serial I/O2 control register (address 3016)) and a serial I/O2 synchronous clock selection bit (bit 2 of serial I/O2 control register).

(1) Serial I/O2 mode selection bit → "1" :

Clock synchronous type serial I/O is selected.

• Setup of a serial I/O2 synchronous clock selection bit

"0" : P06 pin turns into an output pin of a synchronous clock.

"1" : P06 pin turns into an input pin of a synchronous clock.

• Setup of a SDY2 output enable bit (SDY)

"0" : P07 pin can be used as a normal I/O pin.

"1" : P07 pin turns into a SDY2 output pin.

(2) Serial I/O2 mode selection bit → "0" :

Clock asynchronous (UART) type serial I/O is selected.

• Setup of a serial I/O2 synchronous clock selection bit

"0": P06 pin can be used as a normal I/O pin.

"1": P06 pin turns into an input pin of an external clock.

• When clock asynchronous (UART) type serial I/O is selected, it functions P07 pin. It can be used as a normal I/O pin.

## Notes on A/D conversion

### 1. Analog input pin

Make the signal source impedance for analog input low, or equip an analog input pin with an external capacitor of  $0.01\mu\text{F}$  to  $1\mu\text{F}$ . Further, be sure to verify the operation of application products on the user side.

#### <Reason>

An analog input pin includes the capacitor for analog voltage comparison. Accordingly, when signals from signal source with high impedance are input to an analog input pin, charge and discharge noise generates. This may cause the A/D conversion/comparison precision to be worse.

### 2. Clock frequency during A/D conversion

The comparator consists of a capacity coupling, and a charge of the capacity will be lost if the clock frequency is too low. This may cause the A/D conversion precision to be worse. Accordingly, set  $f(XIN)$  in order that the A/D conversion clock is 250 kHz or over during A/D conversion.

### 3. A/D conversion clock selection

Select  $f(XIN)/2$  as an A/D conversion clock by setting the A/D conversion clock selection bit (bit 3 of A/D control register (address 3416)) when RC oscillation is used.

The  $f(XIN)$  can be also used as an A/D conversion clock only when ceramic oscillation or on-chip oscillator is used.

### 4. Read A/D conversion register

#### • 8-bit read

Read only the A/D conversion low-order register (address 3516).

#### • 10-bit read

Read the A/D conversion high-order register (address 3616) first, and then, read the A/D conversion low-order register (address 3516).

In this case, the high-order 6 bits of address 3616 returns "0" when read.

### 5. A/D conversion accuracy

As for AD translation accuracy, on the following operating conditions, accuracy may become low.

(1) Since the analog circuit inside a microcomputer becomes sensitive to noise when  $V_{REF}$  voltage is set up lower than  $V_{CC}$  voltage, accuracy may become low rather than the case where  $V_{REF}$  voltage and  $V_{CC}$  voltage are set up to the same value..

(2) When  $V_{REF}$  voltage is lower than [ 3.0 V ], the accuracy at the low temperature may become extremely low compared with that at room temperature. When the system would be used at low temperature, the use at  $V_{REF}=3.0$  V or more is recommended.

## Notes on Watchdog Timer

1. The watchdog timer is operating during the wait mode. Write data to the watchdog timer control register to prevent timer underflow.

2. The watchdog timer stops during the stop mode. However, the watchdog timer is running during the oscillation stabilizing time after the **STP** instruction is released. In order to avoid the underflow of the watchdog timer, the watchdog timer count source selection bit (bit 7 of watchdog timer control register (address 3916)) before executing the **STP** instruction.

3. The **STP** instruction function selection bit (bit 6 of watchdog timer control register (address 3916)) can be rewritten only once after releasing reset. After rewriting it is disable to write any data to this bit.

## Notes on RESET pin

### 1. Connecting capacitor

In case where the RESET signal rise time is long, connect a ceramic capacitor or others across the RESET pin and the V<sub>SS</sub> pin. And use a 1000 pF or more capacitor for high frequency use. When connecting the capacitor, note the following :

- Make the length of the wiring which is connected to a capacitor as short as possible.
- Be sure to verify the operation of application products on the user side.

#### <Reason>

If the several nanosecond or several ten nanosecond impulse noise enters the RESET pin, it may cause a microcomputer failure.

## Notes on Clock Generating Circuit

### 1. Switch of ceramic and RC oscillations

After releasing reset, the oscillation mode selection bit (bit 5 of CPU mode register (address 3B16)) is "0" (ceramic oscillation selected). When the RC oscillation is used, after releasing reset, set this bit to "1".

### 2. Double-speed mode

The double-speed mode can be used only when a ceramic oscillation is selected. Do not use it when an RC oscillation is selected.

### 3. CPU mode register

Oscillation mode selection bit (bit 5), processor mode bits (bits 1 and 0) of CPU mode register (address 3B16) are used to select oscillation mode and to control operation modes of the microcomputer. In order to prevent the dead-lock by erroneously writing (ex. program run-away), these bits can be rewritten only once after releasing reset. After rewriting, it is disabled to write any data to the bit. (The emulator MCU "M37542RSS" is excluded.) Also, when the read-modify-write instructions (SEB, CLB, etc.) are executed to bits 2 to 4, 6 and 7, bits 5, 1 and 0 are locked.

### 4. Clock division ratio, XIN oscillation control, on-chip oscillator control

The state transition shown in Fig. 78 can be performed by setting the clock division ratio selection bits (bits 7 and 6), XIN oscillation control bit (bit 4), on-chip oscillator oscillation control bit (bit 3) of CPU mode register. Be careful of notes on use in Fig. 78.

### 5. On-chip oscillator operation

When the MCU operates by the on-chip oscillator for the main clock, connect XIN pin to Vcc through a 1 k $\Omega$  to 10 k $\Omega$  resistor and leave XOUT pin open.

The clock frequency of the on-chip oscillator depends on the supply voltage and the operation temperature range.

Be careful that this margin of frequencies when designing application products.

### 6. Ceramic resonator

When the ceramic resonator is used for the main clock, connect the ceramic resonator and the external circuit to pins XIN and XOUT at the shortest distance. Externally connect a damping resistor Rd depending on the oscillation frequency. A feedback resistor is built-in.

Use the resonator manufacturer's recommended value because constants such as capacitance depend on the resonator.

### 7. RC oscillation

When the RC oscillation is used for the main clock, connect the XIN pin and XOUT pin to the external circuit of resistor R and the capacitor C at the shortest distance.

The frequency is affected by a capacitor, a resistor and a microcomputer.

So, set the constants within the range of the frequency limits.

### 8. External clock

When the external signal clock is used for the main clock, connect the XIN pin to the clock source and leave XOUT pin open. Select "0" (ceramic oscillation) to oscillation mode selection bit.

### 9. Count source (Timer 1, Timer A, Timer B, Timer X, Serial I/O, Serial I/O2, A/D converter, Watchdog timer)

The count sources of these functions are affected by the clock division selection bit of the CPU mode register.

The f(XIN) clock is supplied to the watchdog timer when selecting f(XIN) as the CPU clock.

The on-chip oscillator output is supplied to these functions when selecting the on-chip oscillator output as the CPU clock.

However, the watchdog timer is also affected by the function set ROM.

## Notes on Oscillation Control

### 1. Oscillation stop detection circuit

(1) When the stop mode is used, set the oscillation stop detection function to "invalid".

(2) When the ceramic or RC oscillation is stopped by the XIN oscillation control bit (bit 4 of CPU mode register (address 3B16)), set the oscillation stop detection function to "invalid".

### 2. Stop mode

(1) When the stop mode is used, set the oscillation stop detection function to "invalid".

(2) When the stop mode is used, set "0" (STP instruction enabled) to the STP instruction function selection bit of the watchdog timer control register (bit 6 of watchdog timer control register (address 3916)).

(3) The oscillation stabilizing time after release of STP instruction can be selected from "set automatically" / "not set automatically" by the oscillation stabilizing time set bit after release of the STP instruction (bit 0 of MISRG (address 3816)). When "0" is set to this bit, "0116" is set to timer 1 and "FF16" is set to prescaler 1 automatically at the execution of the STP instruction. When "1" is set to this bit, set the wait time to timer 1 and prescaler 1 according to the oscillation stabilizing time of the oscillation. Also, when timer 1 is used, set values again to timer 1 and prescaler 1 after system is returned from the stop mode.

(4) Do not execute the STP instruction during the A/D conversion.

## Notes on On-chip Oscillation Division Ratio

- When the clock division ratio is switched from f(XIN) to on-chip oscillator by the clock division ratio selection bits (bits 7 and 6 of CPU mode register (address 3B16)), the on-chip oscillator division ratio (bits 1 and 0 of on-chip oscillation division ratio selection register (address 3716)) is "102" (on-chip oscillator middle-speed mode (Rosc/8)).

## Notes on Oscillation Stop Detection Circuit

- After the reset by the oscillation stop detection, the value of following bits are retained, not initialized.
  - Ceramic or RC oscillation stop detection function active bit Bit 1 of MISRG (address 3B16)
  - Oscillation stop detection status bit Bit 3 of MISRG
- Oscillation stop detection status bit is initialized ("0") by the following operation.
  - External reset
  - Write "0" data to the ceramic or RC oscillation stop detection function active bit.
- The oscillation stop detection circuit is not included in the emulator MCU "M37542RSS".

## Note on Power Source Voltage

When the power source voltage value of a microcomputer is less than the value which is indicated as the recommended operating conditions, the microcomputer does not operate normally and may perform unstable operation.

In a system where the power source voltage drops slowly when the power source voltage drops or the power supply is turned off, reset a microcomputer when the supply voltage is less than the recommended operating conditions and design a system not to cause errors to the system by this unstable operation.

## Product shipped in blank

As for the product shipped in blank, Renesas does not perform the writing test to user ROM area after the assembly process though the QzROM writing test is performed enough before the assembly process. Therefore, a writing error of approx.0.1 % may occur. Moreover, please note the contact of cables and foreign bodies on a socket, etc. because a writing environment may cause some writing errors.

## NOTES ON HARDWARE

### Handling of Power Source Pin

In order to avoid a latch-up occurrence, connect a capacitor suitable for high frequencies as bypass capacitor between power source pin (Vcc pin) and GND pin (Vss pin). Besides, connect the capacitor to as close as possible. For bypass capacitor which should not be located too far from the pins to be connected, a ceramic capacitor of 0.01  $\mu$ F to 0.1  $\mu$ F is recommended.

## NOTES ON QzROM

### Notes On QzROM Writing Orders

When ordering the QzROM product shipped after writing, submit the mask file (extension: .mask) which is made by the mask file converter MM.

Be sure to set the ROM option ("MASK option" written in the mask file converter) setup when making the mask file by using the mask file converter MM.

### Notes On ROM Code Protect

#### (QzROM product shipped after writing)

As for the QzROM product shipped after writing, the ROM code protect is specified according to the ROM option setup data in the mask file which is submitted at ordering.

Renesas Technology corp. write the value of the ROM option setup data in the ROM code protect address (address FFDB16) when writing to the QzROM. As a result, in the contents of the ROM code protect address the ordered value may differ from the actual written value.

The ROM option setup data in the mask file is "0016" for protect enabled or "FF16" for protect disabled. Therefore, the contents of the ROM code protect address (other than the user ROM area) of the QzROM product shipped after writing is "0016" or "FF16".

Note that the mask file which has nothing at the ROM option data or has the data other than "0016" and "FF16" can not be accepted.

## DATA REQUIRED FOR QzROM WRITING ORDERS

The following are necessary when ordering a QzROM product shipped after writing:

- QzROM Writing Confirmation Form\*
- Mark Specification Form\*
- ROM data.....Mask file

\* For the QzROM writing confirmation form and the mark specification form, refer to the "Renesas Technology Corp." Homepage (<http://www.renesas.com/homepage.jsp>).

Note that we cannot deal with special font marking (customer's trademark etc.) in QzROM microcomputer.

## REVISION HISTORY

## 7546 Group Datasheet

Rev.	Date	Description	
		Page	Summary
1.00	Oct 14, 2005	—	First Edition issued
1.10	Jun 05, 2006	— 1 2, 3 4 9 22 39 41 56 62 67 74 75 76 77 78, 79 80 81 84	“Preliminary” eliminated. Power dissipation added. Fig.1, Fig.2 and Fig.3: part numbers added. Power source voltage (at on-chip oscillator) and power dissipation added. Memory expansion plan: “Under development” eliminated. Notes on use (2): \$0Bn → \$0B Notes on Input Capture; 2nd note: some description added. Block diagram of capture channel 0: address of capture pointer revised. Low Voltage Detection Circuit: bit number of the function set ROM data 0 revised State transition: (4) revised. Wiring for the VPP pin of the QzPROM revised. Electrical characteristics (1) VRAM Min. value is added. Electrical characteristics (2) - Parameter      The condition is added. - Limits      Typ. and Max. values are changed. A/D Converter characteristics - Absolute accuracy      Max. value is revised. Power-on reset circuit characteristics and Low voltage detection circuit added. Timing requirements is added. Switching characteristics is added. Timing chart added. BRK instruction eliminated.
1.20	Aug 30, 2006	9 54, 91 59, 92 70 75 77 91	Table 3: ROM size revised and note added. Notes on watchdog timer: note 3 revised. Notes on clock generating circuit: note added. 5. Setup for I/O ports: Note eliminated. Electrical characteristics (2) - Low voltage detection circuit self consumption current added. Low voltage detection circuit characteristics. - Unit of VLVD      mV → $\underline{V}$ (1) Analog input pin: description revised.
1.21	Nov 15, 2006	73	All f(XIN): VCC condition added.

## Renesas Technology Corp. Sales Strategic Planning Div. Nippon Bldg., 2-6-2, Ohte-machi, Chiyoda-ku, Tokyo 100-0004, Japan

### Notes:

1. This document is provided for reference purposes only so that Renesas customers may select the appropriate Renesas products for their use. Renesas neither makes warranties or representations with respect to the accuracy or completeness of the information contained in this document nor grants any license to any intellectual property rights or any other rights of Renesas or any third party with respect to the information in this document.
2. Renesas shall have no liability for damages or infringement of any intellectual property or other rights arising out of the use of any information in this document, including, but not limited to, product data, diagrams, charts, programs, algorithms, and application circuit examples.
3. You should not use the products or the technology described in this document for the purpose of military applications such as the development of weapons of mass destruction or for the purpose of any other military use. When exporting the products or technology described herein, you should follow the applicable export control laws and regulations, and procedures required by such laws and regulations.
4. All information included in this document such as product data, diagrams, charts, programs, algorithms, and application circuit examples, is current as of the date this document is issued. Such information, however, is subject to change without any prior notice. Before purchasing or using any Renesas products listed in this document, please confirm the latest product information with a Renesas sales office. Also, please pay regular and careful attention to additional and different information to be disclosed by Renesas such as that disclosed through our website (<http://www.renesas.com>).
5. Renesas has used reasonable care in compiling the information included in this document, but Renesas assumes no liability whatsoever for any damages incurred as a result of errors or omissions in the information included in this document.
6. When using or otherwise relying on the information in this document, you should evaluate the information in light of the total system before deciding about the applicability of such information to the intended application. Renesas makes no representations, warranties or guarantees regarding the suitability of its products for any particular application and specifically disclaims any liability arising out of the application and use of the information in this document or Renesas products.
7. With the exception of products specified by Renesas as suitable for automobile applications, Renesas products are not designed, manufactured or tested for applications or otherwise in systems the failure or malfunction of which may cause a direct threat to human life or create a risk of human injury or which require especially high quality and reliability such as safety systems, or equipment or systems for transportation and traffic, healthcare, combustion control, aerospace and aeronautics, nuclear power, or undersea communication transmission. If you are considering the use of our products for such purposes, please contact a Renesas sales office beforehand. Renesas shall have no liability for damages arising out of the uses set forth above.
8. Notwithstanding the preceding paragraph, you should not use Renesas products for the purposes listed below:
  - (1) artificial life support devices or systems
  - (2) surgical implantations
  - (3) healthcare intervention (e.g., excision, administration of medication, etc.)
  - (4) any other purposes that pose a direct threat to human lifeRenesas shall have no liability for damages arising out of the uses set forth in the above and purchasers who elect to use Renesas products in any of the foregoing applications shall indemnify and hold harmless Renesas Technology Corp., its affiliated companies and their officers, directors, and employees against any and all damages arising out of such applications.
9. You should use the products described herein within the range specified by Renesas, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas shall have no liability for malfunctions or damages arising out of the use of Renesas products beyond such specified ranges.
10. Although Renesas endeavors to improve the quality and reliability of its products, IC products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Please be sure to implement safety measures to guard against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other applicable measures. Among others, since the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.
11. In case Renesas products listed in this document are detached from the products to which the Renesas products are attached or affixed, the risk of accident such as swallowing by infants and small children is very high. You should implement safety measures so that Renesas products may not be easily detached from your products. Renesas shall have no liability for damages arising out of such detachment.
12. This document may not be reproduced or duplicated, in any form, in whole or in part, without prior written approval from Renesas.
13. Please contact a Renesas sales office if you have any questions regarding the information contained in this document, Renesas semiconductor products, or if you have any other inquiries.

### RENESAS SALES OFFICES

<http://www.renesas.com>

Refer to "<http://www.renesas.com/en/network>" for the latest and detailed information.

**Renesas Technology America, Inc.**  
450 Holger Way, San Jose, CA 95134-1368, U.S.A  
Tel: <1> (408) 382-7500, Fax: <1> (408) 382-7501

**Renesas Technology Europe Limited**  
Dukes Meadow, Millboard Road, Bourne End, Buckinghamshire, SL8 5FH, U.K.  
Tel: <44> (1628) 585-100, Fax: <44> (1628) 585-900

**Renesas Technology (Shanghai) Co., Ltd.**  
Unit 204, 205, AZIACenter, No.1233 Lujiazui Ring Rd, Pudong District, Shanghai, China 200120  
Tel: <86> (21) 5877-1818, Fax: <86> (21) 6887-7898

**Renesas Technology Hong Kong Ltd.**  
7th Floor, North Tower, World Finance Centre, Harbour City, 1 Canton Road, Tsimshatsui, Kowloon, Hong Kong  
Tel: <852> 2265-6688, Fax: <852> 2730-6071

**Renesas Technology Taiwan Co., Ltd.**  
10th Floor, No.99, Fushing North Road, Taipei, Taiwan  
Tel: <886> (2) 2715-2888, Fax: <886> (2) 2713-2999

**Renesas Technology Singapore Pte. Ltd.**  
1 Harbour Front Avenue, #06-10, Keppel Bay Tower, Singapore 098632  
Tel: <65> 6213-0200, Fax: <65> 6278-8001

**Renesas Technology Korea Co., Ltd.**  
Kukje Center Bldg. 18th Fl, 191, 2-ka, Hangang-ro, Yongsan-ku, Seoul 140-702, Korea  
Tel: <82> (2) 796-3115, Fax: <82> (2) 796-2145

**Renesas Technology Malaysia Sdn. Bhd**  
Unit 906, Block B, Menara Amcorp, Amcorp Trade Centre, No.18, Jalan Persiaran Barat, 46050 Petaling Jaya, Selangor Darul Ehsan, Malaysia  
Tel: <603> 7955-9390, Fax: <603> 7955-9510
